Audience and Purpose

This guide is intended for system and network administrators charged with installing and maintaining a NEO XL-Series Tape Library. It provides information on the installation, configuration, operation, service, and maintenance of the library. Administrators should be familiar with the basic concepts and tasks of network administration.

Warnings

• Only trained personnel should operate this equipment.
• Read all documentation and procedures before installation or operation.
• The tape library must only be installed in a Restricted Area.
• Only personnel with technical and product-safety training should be provided access to the library.
• For safety reasons, the default administrator PIN for the Operator Control Panel needs to be changed during initial configuration.
• Hazardous moving parts exist inside this product. Do not insert tools or any parts of your body into the interior of the library while the mailslot or magazine is pulled out.
• Do not insert any tools or any parts of your body into drive bay openings or any other openings of an operating system.

Avertissement

• Cet équipement ne doit être utilisé que par un personnel formé.
• Lisez la totalité de la documentation et des procédures avant toute installation ou utilisation.
• Ce produit est conçu pour l'installation et l'utilisation dans un rack d'ordinateur avec les portes avant et arrière fermées et sécurisées.
• Seul un personnel avec la formation technique et de sécurité des produits est autorisé à accéder à la bibliothèque.
• Ce personnel est désigné par utilisateurs dans la totalité de ce document.
• Pour des raisons de sécurité, le PIN d'administrateur par défaut doit être changé au cours de la configuration initiale.
• Les pièces mobiles dangereuses existent à l'intérieur de ce produit. N'insérez pas d'outils ni partie du corps dans les ouvertures d'un système en marche.

Note
• Ventilation – Place the product in a location that does not interfere with proper ventilation.
• Heat – Place the product in a location away from heat sources.
• Power sources – Connect the product to a power source only of the type directed in the operating instructions or as marked on the product.
• Power cord protection – Place the AC line cord so that it is not possible to be walked on or pinched by items placed upon or against it.
• Object and liquid entry – Insure that objects do not fall onto and that liquids are not spilled into the product’s enclosure.

Remarque
• Ventilation – Placez le produit dans un endroit qui n'interfère pas avec une ventilation approprié.
• Chaleur – Placez le produit dans un endroit loin de sources de chaleur.
• Alimentation électrique – Veuillez ne brancher le produit qu’à une source d'alimentation correspondant aux instructions figurant dans le mode d'emploi ou comme directement indiqué sur le produit.
• Protection du cordon d'alimentation – Placez le cordon d'alimentation principal de sorte qu'il ne soit pas possible de marcher dessus ou d'être écrasé par des objets placés sur ou contre.
• Pénétration d'objets et de liquide – S'assurez que des objets ne tombent pas sur le boîtier du produit et que des liquides ne soient pas déversés dans le boîtier du produit.

General Warnings

Electrostatic Discharge

To prevent damaging the system, be aware of the precautions you need to follow when setting up the system or handling parts. A discharge of static electricity from a finger or other conductor may damage system boards or other static-sensitive devices. This type of damage may reduce the life expectancy of the device.

Preventing Electrostatic Damage. To prevent electrostatic damage, observe the following precautions:

• Avoid hand contact by transporting and storing products in static-safe containers.
• Keep electrostatic-sensitive parts in their containers until they arrive at static-free workstations.
• Place parts on a grounded surface before removing them from their containers.
• Avoid touching pins, leads, or circuitry.
• Always be properly grounded when touching a static-sensitive component or assembly. See the next section.

**Grounding Methods.** There are several methods for grounding. Use one or more of the following methods when handling or installing electrostatic-sensitive parts:

• Use a wrist strap connected by a ground cord to a grounded workstation or computer chassis. Wrist straps are flexible straps with a minimum of 1 megohm (±10 percent) resistance in the ground cords. To provide proper ground, wear the strap snug against the skin.
• Use heel straps, toe straps, or boot straps at standing workstations. Wear the straps on both feet when standing on conductive floors or dissipating floor mats.
• Use conductive field service tools.
• Use a portable field service kit with a folding static-dissipating work mat.

If you do not have any of the suggested equipment for proper grounding, have an authorized reseller install the part. For more information on static electricity, or assistance with product installation, contact your authorized reseller.

**Product Warranty Cautions**

The customer should only perform the service and repair actions on the tape library components as described in this document. Any other actions needed should only be performed by an authorized service center.

The warranty for the tape library shall not apply to failures of any unit when:

• The tape library is repaired or modified by anyone other than the manufacturer’s personnel or approved agent.
• The tape library is physically abused or used in a manner that is inconsistent with the operating instructions or product specification defined by the manufacturer.
• The tape library fails because of accident, misuse, abuse, neglect, mishandling, misapplication, alteration, faulty installation, modification, or service by anyone other than the factory service center or its approved agent.
• The tape library is repaired by anyone, including an approved agent, in a manner that is contrary to the maintenance or installation instructions supplied by the manufacturer.
• The manufacturer's serial number tag is removed.
• The tape library is damaged because of improper packaging on return.

Warranty becomes immediately void in the event of unauthorized repairs or modifications.
## Conventions

This document exercises several alerts and typographical conventions.

Regulatory Information

Disposal of Waste Equipment by Users in Private Households in the European Union and Norway

This symbol on the product or on its packaging indicates that this product must not be disposed of with your other household waste. Instead, it is your responsibility to dispose of your equipment by handling it over to a designated collection point for the recycling of waste electrical and electronic equipment. The separate collection and recycling of your waste equipment at this time of disposal will help to conserve natural resources and ensure that it is recycled in a manner that protects human health and the environment. For more information about where you can drop off your waste equipment for recycling, please contact your local city office, your household waste disposal service, or the shop where you purchased the product.

CE Mark

The CE mark is a mandatory conformity mark on many products placed on the single market in the European Economic Area (EEA). The CE marking certifies that a product has met EU consumer safety, health or environmental requirements.

CCL Mark

FCC (United States)

The computer equipment described in this manual generates and uses radio frequency (RF) energy. If the equipment is not installed and operated in strict accordance with the manufacturer’s instructions, interference to radio and television reception might result.

This equipment complies with Part 15 of the FCC Rules. Operation is subject to the following conditions: (1) This device may not cause harmful interference, and (2) this device must accept any interference received, including interference that may cause undesired operation.

Part 15, Class A, of the FCC Rules, is designed to provide reasonable protection against radio and television interference in a residential installation. Although the equipment has been tested and found to comply with the allowed RF emission limits, as specified in the above-cited Rules, there is no guarantee that interference will not occur in a particular installation. Interference can be determined by turning the equipment off and on while monitoring radio or television reception. The user may be able to eliminate any interference by implementing one or more of the following measures:
• Reorient the affected device and/or its receiving antenna.
• Increase the distance between the affected device and the computer equipment.
• Plug the computer and its peripherals into a different branch circuit from that used by the affected device.
• If necessary, consult an experienced radio/television technician for additional suggestions.

**Canadian Verification**

This Class A digital apparatus meets all requirements of the Canadian Interference-Causing Equipment Regulations (ICES-003, Class A).

**Product Documentation**

NEO product documentation and additional literature are available online at the Overland-Tandberg Knowledge Base:

https://community.sphere3d.com/welcome

Use the Search, Featured Content, and Knowledge Center options to access the information you need.

**Firmware Updates**

The latest release of the NEO XL-Series firmware can be obtained from the Downloads and Resources page at the Overland Storage website:

http://docs.overlandstorage.com/neo

Follow the appropriate instructions to download the latest software file.

For additional assistance, search at http://support.overlandstorage.com/

**Technical Support**

You can email our technical support staff at techsupport@overlandstorage.com or get additional technical support information on the Contact Us web page at:

https://www.overlandstorage.com/company/contact-us/index.aspx

Master Glossary & Acronym List

Index
Overview

All NEOxl 80 installations begin with the Base Module with a capacity for 80 tape cartridges and 6 half-height LTO tape drives.

The NEOxl 80 is expandable, allowing a user to grow their tape storage capacity as their data requirements increase. As data storage needs grow, the NEOxl 80 can also grow by adding one or more Expansion Modules. Each Expansion Module provides an additional 80 tape cartridge slots and supports an additional 6 half-height LTO tape drives.

Up to six Expansion Modules can be added to a Base Module (three above and three below), bring the total library capacity to 560 tape cartridges and 42 half-height LTO tape drives.

Topics in Overview:
- Supported Configurations
- Base Module Front Panel
- Module Rear Panels
- Drive Sled Back Panels
- Power Supply Rear Panel LEDs
- Element Numbering
- Supported Tape Cartridges

Supported Configurations

A NEO X-Series Tape Library is configured as a rackmount system consisting of a Base Module and up to six optional Expansion Modules (three above and three below).

Rackmount Configurations

The following table shows all the supported configurations for libraries ranging from one to seven total modules.

<table>

Configurations with Legacy Serial ADI Drive Sleds

The NEOxl 80 supports serial ADI drive sleds. At least one Drive Power Board (DC-DC converter) is required in each module that has drives installed. The following table describes the supported serial ADI configurations for each module type.

Supported Tape Drives

The NEOxl 80 was developed to integrate industry-standard LTO Ultrium tape drives from IBM. Mixed drive generations and mixed interfaces are supported within a single library and within a single module.
Listed below are the tape drives that have been implemented and qualified for use in the tape library.

**WARNING:** To avoid injury, we recommend the use of a mechanical lifting aid (or at least two persons) for rack installation or removal. Use caution during rack installation or removal to avoid accidentally tilting or tipping the rack or injuring yourself. To reduce the risk of electric shock or damage to equipment, always remove any power cords while working with the equipment.

**WARNUNG:** Um Verletzungen zu vermeiden, empfehlen wir zur Rack-Installation oder -Deinstallation die Nutzung einer mechanischen Hebehilfe (oder mindestens zwei Personen). Seien Sie vorsichtig bei der Rack-Installation oder -Entnahme, um ein versehentliches Kippen des Racks zu vermeiden und das Rack nicht zu beschädigen bzw. sich selbst zu verletzen. Um das Risiko eines elektrischen Schlags oder Schäden am Gerät zu vermeiden, ziehen Sie stets den Netzstecker, bevor Sie an der Einheit arbeiten.

**AVERTISSEMENT:** Afin d’éviter des blessures pendant l’installation, il est recommande d’utiliser un monte-charge (ou au moins deux personnes) pour élever ou aligner l’module. Faites attention lorsque vous insérez ou retirez l’module d’un support, pour empêcher le déversement accidentel de la crémaillère causant des dommages et des blessures. Pour réduire le risque de choc électrique ou endommagement de l’équipement, retirez toujours les cordons électriques en travaillant avec l'équipement.

---

**Topics in Installation:**

- Plan the Installation
- Installation Precautions
- Library Module Preparation
- Install Modules in Rack
- Attach Library Cables

---

**Plan the Installation**

These four planning steps are necessary to install your NEO:

- Choose a location for the library.
- Plan the SAS or Fibre Channel configuration and obtain the necessary cables.
- For rack installations, plan the rack layout.
- Select the Internal IP range.

**Location Requirements**

The library was designed for rack installation and must use the provided rack rails.
Select a location with access to the host server that meets the criteria in the table below.

<table>
<thead>
<tr>
<th>Criteria</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Rack Requirements</td>
<td>Standard 19-inch rack (minimum depth of 1 meter) with an appropriate number of Rack Units of clearance for the planned module quantity.</td>
</tr>
<tr>
<td>Rack Space Requirements</td>
<td>6U for the Base Module plus 6U for each Expansion Module.</td>
</tr>
<tr>
<td>Room Temperature</td>
<td>10-35°C (50-95°F)</td>
</tr>
<tr>
<td>Power Source</td>
<td>• AC power voltage: 100-240 VAC</td>
</tr>
<tr>
<td></td>
<td>• Line frequency: 50-60 Hz</td>
</tr>
<tr>
<td></td>
<td>• Library located near AC Outlets</td>
</tr>
<tr>
<td></td>
<td>The AC power cord is the library’s main AC disconnect device and must be easily accessible at all times.</td>
</tr>
<tr>
<td>Air Quality</td>
<td>• Place the library in an area with minimal sources of particulate contamination.</td>
</tr>
<tr>
<td></td>
<td>• Avoid areas near frequently used doors and walkways, stacks of supplies that collect dust, printers, and smoke-filled rooms.</td>
</tr>
<tr>
<td></td>
<td>• Excessive dust and debris can damage tapes and tape drive.</td>
</tr>
<tr>
<td>Humidity</td>
<td>20% to 80% RH non-condensing.</td>
</tr>
</tbody>
</table>

**Bus Interface**

Plan either for a SAS or Fibre Channel configuration, determining the parameters to be used (such as speed) and obtaining the necessary cables.

**SAS Configuration Requirements**

Serial Attached SCSI (SAS) is a computer bus technology mainly used to transfer data to and from storage devices, including disk drives and tape drives. Supported SAS speeds by all tape drives are 1.5 Gbps, 3 Gbps, and 6 Gbps.

SAS uses serial connections, with a direct connection between the host server and each of the storage devices. This eliminates the need to configure SCSI buses and assign SCSI IDs, as is required for parallel SCSI devices.

The host server must have a SAS Host Bus Adapter (HBA) with an external connector. The HBA uses multiple Logical Unit Numbers (LUNs) to communicate with the library. Verify that your HBA supports multiple LUNs, as most RAID controllers do not. Most SAS HBA ports have four SAS channels. A tape drive uses one channel, so each HBA port can support up to four tape drives. You can use a cable with one connector on each end, but only one channel will be used.

⚠️ **CAUTION:** High quality SAS cables rated at the transfer rate the SAS drives are required. Always verify that the SAS cable you are using is rated for the data transfer speed of the interface of your components. SAS cables described as “equalized” may not support 6 Gb/s data rates and should not be used with LTO-5 or later generation tape drives unless these cables are verified for 6 Gb/s data rates.

The library has one or more mini-SAS connectors on each SAS tape drive. Mini-SAS connectors are keyed. Do not force a SAS cable’s mini-SAS connector into the tape drive as it might be keyed differently.
A SAS tape drive is identified by a unique identifier called a World Wide Name (WWN) or World Wide Identifier (WWID). The library assigns the WWID to the drive bay. When a tape drive is replaced, the WWID is re-assigned to the new tape drive.

The operating system tracks the WWID for the tape drive on each HBA channel. Each of the drive connectors on the fan-out cable is associated with an HBA channel. Once a tape drive has been plugged in, it should remain on the same channel to retain the association between the HBA channel and WWID.

**Fibre Channel Configuration Requirements**

The Fibre Channel (FC) tape drive can be connected directly to the server with a Host Bus Adapter (HBA) or through a storage area network (SAN).

The installation requires one Fibre Channel cable for each tape drive. The tape drives all utilize an LC-style connector. Some drives have two FC ports, but only one cable connection is needed per drive. The cable can be connected to either drive FC port.

Supported speeds by all tape drives are 2 Gbps, 4 Gbps, and 8 Gbps.

---

**IMPORTANT:** Use an appropriate HBA for your tape drive due to performance requirements. A lower Gbps HBA might result in performance degradation when moving highly compressible data to a higher Gbps tape drive.

In a SAN installation, all switches between the host and the library must be of the appropriate type. A lower Gbps switch in the path may result in performance degradation. Configure zoning so only the backup servers may access the library.

---

**Planning Module and Rack Layout**

If possible, install the Base Module in the middle of the rack to provide space for the permitted three Expansion Modules above and three Expansion Modules below. See Chapter 1, “Supported Configurations,” for additional details.

**Internal IP Range Selection**

For internal communication between modules the tape library uses an Ethernet connection with an internal IP address range. To prevent any conflict between the internal IP address range and the external IP addresses it is required to select the internal IP range before the tape library gets connected to the external Ethernet port.

A file which contains the internal IP range is stored onto the Base Module backplane.

The values must be in the format “RANGE=192.0.2”.

---

**Internal and external IP conflict prevention.**

Please select an IP-Range which is not used by your environmental network:

192.0.2.0/24

Submit

---

**NOTE:** The last section of the IP address is not set because it is set internally.
The file is created through the Operator Control Panel (OCP) IP Range selection screen when the library starts for the very first time or if the unit was reset to Manufacturing Defaults / Reset via OCP or Remote Management Interface (RMI).

Follow these general guidelines:

- Check with a system administrator before powering off the host computer.
- For a SAS library, confirm availability or install a SAS HBA that supports multiple LUNs.
- For a direct-attach Fibre Channel library, confirm availability of install an FC HBA.
- For connection of a Fibre Channel library through a compatible switch, verify that sufficient ports are available.

### Installation Precautions

#### Warnings:

**Product weight.** Each NEOxl 80 module weighs about 90 lbs. (43kg) without drives or tapes. Before moving or lifting the module, remove the tape magazines and drives to reduce the weight.

**Risk of personal injury.** Before moving or lifting a module:

- Observe local health and safety requirements and guidelines for manual material handling.
- Remove all tapes to reduce the weight and to prevent cartridges from falling into the robotics path and damaging the library.
- Remove all tape drives to reduce the weight.
- Obtain adequate assistance to lift and stabilize the module during installation or removal.

**Risk of damage to devices.** When placing a module into or removing the module from a rack:

- Extend the rack’s leveling jacks to the floor.
- Ensure that the full weight of the rack rests on the leveling jacks.
- Install stabilizing feet on the rack.
- Extend only one rack component at a time.

#### Poids du produit:

Chaque module de bibliothèque pèse 43kg sans média ni lecteur de bande. Lors du déplacement de la bibliothèque, pour réduire les risques de blessures ou de détérioration du périphérique.

- Respectez les règles locales de santé et de sécurité au travail ainsi que les instructions concernant la manipulation du matériel.
- Retirez les bandes des lecteurs avant de déplacer un module.
- Retirez toutes les bandes pour réduire le poids global du périphérique et pour empêcher les cartouches de tomber dans le chemin robotique et d’endommager la bibliothèque. Disposez les cartouches de sorte qu’elles réintègrent leur emplacement d’origine.
- Faites-vous assister pour soulever et stabiliser le périphérique pendant l’installation ou le retrait.
Static Sensitive

Risk of damage to devices exists:
- A discharge of static electricity damages static-sensitive devices or micro circuitry.
- Proper packaging and grounding techniques are necessary precautions to prevent damage.

Électricité statique

Risque d'endommager les périphériques par une décharge d'électrostatique:
- Une décharge d'électricité statique peut endommager les circuits imprimés du système ou les autres périphériques sensibles aux décharges électrostatiques.
- Un emballage approprié et une mise à la terre constituent les précautions nécessaires pour éviter tout dommage.

Moisture

CAUTION: Do not expose the library to moisture. Do not place a module on either the module ends or sides as this may cause damage.

If the temperature in the room where the library operates varies by 15 °C (30 °F) or more from where the module was stored, allow it to acclimate for at least 12 hours prior to unpacking.

Library Module Preparation

Components

The following components are shipped in each module box:
- Base or Expansion Module
- Two Rack Rails
- Accessory Kit containing:
  - One Rackmount Hardware Kit
  - Two North American power cords
  - Two European power cords
  - Expansion Interconnect Cable (Expansion Module only)
  - NEOxl 80 Quick Start Guide

For SAS libraries, you must provide SAS cabling with the correct configuration for your HBA. For Fibre Channel libraries, you must provide one Fibre Channel cable for each tape drive.

Preparing Top and Bottom Modules

NOTE: Skip this step if you are installation a Base Module without Expansion Modules.

The Base Module has removable top and bottom covers. You need to transfer one or both covers from the Base Module to Expansion Modules. The covers are identical and the procedure to change them is the same for both top and bottom covers.
• If you are installing Expansion Modules below the Base Module, move the bottom cover from the Base Module to the Expansion Module that will be installed at the bottom of the library.
• If you are installing Expansion Modules above the Base Module, move the top cover from the Base Module to the Expansion Module that will be installed at the top of the library.

To move a library cover plate from the Base Module to an Extension Module:

1. Remove the library cover plate from the Base Module.
   a. Place the **Base Module** on a work table.
      If you are removing the bottom cover, gently turn the Base Module over so you can access the bottom of the module.
   b. Insert a small flathead screwdriver or **Torx tool** down into the hole to release the spring lock (1).
   c. Slide the cover forward (2) until it reaches the tool in the hole, remove the tool, and continue sliding the cover to the front until all the tabs are released.
   d. Remove the **cover** (3) from the module.
   e. If the Base Module is upside down, gently return it to its normal position.

2. Install the cover on the Expansion Module.
   a. Place the Expansion Module on the work table.
      If the module will be the bottom module in the library, gently turn the module over so you can access the bottom of the module.
   b. Align all cover tabs with the slots on the module, gently push the cover down, and then slide it towards the back of the module until the spring lock (1) engages.
   c. If the Expansion Module is upside down, gently return it to its normal position.

**Install Modules in Rack**

NEO modules are easy to install in racks compliant to the EIA 310A Standard. You need a #2 Phillips screwdriver for this process.
Install the Rack Rails

To locate the rail locations when installing multiple modules:

**NOTE:** Each module requires 6U (10.5 inches) of rack space each.

1. Determine the location in your rack for your module to be installed and, using a pencil, mark the location on each vertical rail in your rack. It is recommended to start at the lowest position of the rack for stability. The bottom mark should be at the lowest narrow gap.

2. From the front of the rack, insert the rack rails into the back and then front vertical supports.

   a. Position a rail according to the orientation information stamped on the rail.
   
   b. Rotate the front of the rail up while inserting the rear rail hanger into the rear vertical support, and then lower the front of the rail until it is nearly level.
   
   c. Extend the front of the rail until the hangers come through the holes in the vertical support and the retention spring snaps into place.
   
   d. Repeat Steps a–c the other rail.

**NOTE:** The rails must be fastened with the bottom of each rail parallel to floor and at the same level.
3. On the front of both rails in a square-hole lock, install a clip nut above the mounting bracket as shown (1) and, for increased stability, install the retention inserts (2).

4. For increased stability, install the supplied retention inserts (3).

Insert the Modules in the Rack

1. Extend the middle rails until they lock into place.
2. Move the sliding assembly to the front of the middle rails.
3. Using the mechanical lifter, position the library in front of the rack, aligned with the extended rails.
4. Slide the library onto the middle rails and into the rack until it stops.

5. Using your fingers, secure it to the rack with the captive screws on the front of the library.

Aligning and Connecting Modules

NOTE: Skip this step if the library does not have Expansion Modules.
Aligning the modules ensures that the robot can move freely between the modules. The library will not operate unless the alignment mechanism is in the locked position.

1. At the front of the library, loosen the **thumbscrews** on each module two full turns.
2. At the back of the library, starting with the bottom pair of modules, **align each module** with the module below it by loosening the thumbscrew (1), lowering the mechanism (2), and then re-tightening it (3).

   ![Image of module alignment process]

   If you encounter resistance, adjust the upper module so that the alignment mechanism pin moves into the mating hole in the lower module.

3. Repeat **Step 2** for each pair of modules.
4. Verify that the **lowest module** in the library has its alignment mechanism in the unlocked position.
5. At the front of the library, tighten the **thumbscrews** on all of the modules to secure the modules to the rack.
6. Connect the **expansion interconnect** cables from the module ports to any adjacent modules.
Attach Library Cables

**CAUTION:** It is recommended that you shut down and turn OFF the associated server. Turn OFF all attached devices. Remove the power cables from the server and all attached accessories. Failure to remove the power cords from these devices before connecting the host interface cable could result in damage to the library.

All cabling, power connections, and cooling are located on the rear panel.

1. Attach one end of the **host interface cable** to the library:
   - For a Serial Attached SCSI (SAS) connected library, attach one end of the **SAS cable** to Port A (top) SAS HBA on the SAS drive.
     If you are using a SAS fanout/hydra cable, attach one mini-SAS connector into the connector on each tape drive. The unused ends of the SAS fanout cable are single channel and not suitable for use with disk arrays. Use the other ends to connect tape drives, or coil and secure them to the rack to minimize stress on the connectors.
   - For a Fibre Channel (FC) library, attach one end of the **fibre cable** to Port A (top) connector on the FC drive, removing the cap if necessary.

2. Attach the **other end** of the host interface cable as follows:
   - For a SAS library, connect the **host interface cable** to the host HBA, using a direct SFF-8088 connection. Unused SAS connectors do not need termination.
     If you are using a SAS fanout/hydra cable, the end of the cable with only one connector should be plugged into the HBA
   - For a Fibre Channel library, connect the **fibre cable** to the host or to a switch.
3. Plug the **network Ethernet (management) cable** into the bottom Ethernet port (2) on the rear panel of the library.

   If the Ethernet connection is directly attached to a server or laptop, a crossover Ethernet cable may be required.

   ![Diagram showing network Ethernet ports](image)

   **NOTE:** It is the customer's responsibility to supply the crossover cable if one is required.

4. For remote access, connect the **network Ethernet (management) cable** to your network.

5. Plug the **power cables** into the power connectors (1) on each module and into power outlets.

   **NOTE:** The library has dual redundant power supplies. To increase redundancy, plug each power cord into a different AC power circuit.
Once all the NEO hardware is installed and connected, the first step is to start configure the library:

- Power on the library.
- Resolve the network IP address.
- Run the Initial Configuration Wizard from the OCP. The wizard guides you through configuring:
  - The administrator PIN.
  - Timezone, date, and time settings.
  - Basic network configuration.
  You can skip wizard items and stop the wizard at any time. When done, an initial system test begins.
- Complete the configuration using the RMI.

This chapter provides the detailed steps for the items outlined above.

**Topics in Initial Setup:**

- Powering On the Library
- Initial Setup Using the OCP Wizard
- Verifying the Host Connection
- Loading Tape Cartridges
- Verifying the Installation
- Configuring Additional Features

### Powering On the Library

Power on the library from the Base Module OCP panel by pressing and holding down the power button for three (3) seconds. As the library is powered on, it inventories the tape cartridges in the magazines, checks the firmware version on all modules, configures the tape drives, searches for any new modules, and checks the network.

The green light on the front panel illuminates indicating the library status is ready.

At this first time power on, the library displays a message on the OCP display that the network IP is incorrect. Use the OCP to update the IP address:

**NOTE:** For complete details, also refer to Chapter 5, “Operator Control Panel.”

1. Using the navigation buttons, go to the OCP Configuration > Network Settings screen.
2. Configure the following settings as needed:
   - Host Name
• Domain Name
• Protocol
• IPv4 or IPv6 related settings

3. Press **Down** to navigate to **Submit**.
4. Press **Enter**.
   The tape library automatically reboots.

**Initial Setup Using the OCP Wizard**

Once you have configured the network settings and the tape library has rebooted, the user is prompted to walk through the Initial Configuration wizard. The wizard guides you through configuring the time zone, date and time, network settings, setting the administrator password, and then start an initial system test. You can skip items and stop the wizard at any time. Once you have configured the network settings and set the administrator password, you can initiate the wizard from the RMI to complete the remaining configurations.

**NOTE:** It is recommended to walk completely through the wizard and finish it by pressing the **Finish Button**. Otherwise, with every login on the OCP, the user is prompted to walk through the wizard again.

**Verifying the Host Connection**

To verify the connections between the host computer and the library:

1. Install the **application software and/or drivers** that are compatible with the library. Backup software packages might require additional software or licensing to communicate with the robotics.
2. Verify the connection between the library and the host using the host server’s **operating system utilities**.

**Loading Tape Cartridges**

The library can be powered on without cartridges, but needs to have cartridges installed before performing either data read/write operations, or any tests or operations that transfer cartridges.

**Labeling Tape Cartridges**

Barcode labels are recommended in production environments to improve inventory time in the library and ease cartridge handling processes outside the library. Refer to **Tape Cartridge Use and Maintenance** in Chapter 4, “Basic Library Operation.”
Using the Mailslot to Load Tape Cartridges

If the mailslot is enabled, you can use it to load cartridges into the library. On the Home screen, tap **Open Mailslot**, open the magazine access door, and then pull the mailslot out.

Bulk Loading Magazines

1. Extend one of the **magazines** from the library.
   a. From the OCP or RMI, select the **module** and then select **Open Magazine**.
   b. Open the magazine **access door**.

2. Load the **tape cartridges** into the magazine starting with the back of the magazine. Push the magazine in the library as each vertical bin is filled.

3. Push the **magazine handle** slowly inward until the magazine release latch snaps into place, securing the magazine.

4. Repeat Steps 1–3 for each of the **other magazines** being loaded.

Verifying the Installation

Verify that the library has the **current firmware** revision.

The library firmware revision is displayed in the top left corner of the RMI Home page or on the OCP **Home > Status > Library > Library Status** screen.
If necessary, update the library firmware. You can update firmware from the RMI (Maintenance > Firmware Upgrades > System Firmware) or the OCP (Maintenance > Library Firmware Upgrade).

After configuring the library, you can save the configuration settings to a USB flash drive from the OCP or to a file on your computer from the RMI Configuration > Save/Restore page. Having a backup of the library configuration is helpful when recovering from a configuration error or if the library needs service. See Save/Restore Library Configuration on page 81 in Chapter 6, “Remote Management Interface.”

### Configuring Additional Features

Additional features can be set up at this time using the OCP.

**Enabling and Configuring SNMP Network Management**

See SNMP Configuration on page 89 in Chapter 6, “Remote Management Interface.”

**Email Event Notification**

See SMTP Configuration on page 90 in Chapter 6, “Remote Management Interface.”

**Modifying the Default Tape Drive Settings**

- **NOTE:** When connecting an LTO-7 or later FC tape drive directly to the host, configure the FC port in Loop mode.

  See Drive Configuration on page 92 in Chapter 6, “Remote Management Interface.”

**Enabling the Mailslot**

See Mailslots Configuration on page 94 in Chapter 6, “Remote Management Interface.”

**Configuring Partitioning**

- **Basic Partition Wizard** – Use the Basic Partition Wizard to configure partitions that will have similar resources or to configure the number of bar code characters to report to the host application and whether to report them from the left or right end of the label for a library with a single partition.

  **Expert Partition Wizard** – Use the Expert Partition Wizard to configure partitions that will have different resources or to adjust resource assignments for existing partitions or those partitions created with the Basic Partition Wizard.

  See Partition Configuration on page 94 in Chapter 6, “Remote Management Interface.”
This chapter covers the basic functions used to operate your NEO XL-Series Tape Library.

The library has two main interfaces:

- **Operator Control Panel (OCP)** — Monitor, configure, and control the library from the Base Module front panel.
- **Remote Management Interface (RMI)** — Monitor, configure, and control the library from a web browser. The RMI hosts a dedicated, protected Internet site that displays a graphical representation of the library. It is accessed via the Ethernet network connection on the rear panel.

**Topics in Basic Library Operation:**

- User Levels
- OCP Library Operation
- RMI Library Operation
- Magazine Manual Release
- Tape Cartridge Use and Maintenance

**User Levels**

The user levels and default passwords for both the OCP and the RMI:

- **User** – No password is required (leave the **Password** blank unless the user password has been set at **Configuration > User Accounts**). The user account provides access to status information, but not the configuration, maintenance, or operation functions.

- **Administrator** – The administrator password is required to login as the administrator. The default administrator password is “adm001” for the first login. The administrator password can then be changed at **Configuration > User Accounts**. The administrator user has access to all functionality except the log configuration, Security access, and Service access.

- **Security** – The default security password is set at the factory to “sec001”. The security password can be changed at **Configuration > User Accounts**. The security user has access to all functionality except the log configuration and Service access.

- **Service** – Access to the Service user is by Service personnel only. The service password is set at the factory. Both the administrator and service passwords are required for a service person to enter the Service area.
OCP Library Operation

The Base Module front OCP panel has an LCD display, with a power button, five LEDs, and an USB port below the display. With the OCP you can monitor, configure, and operate most library functions from the library front panel.

For full details, see Chapter 5, “Operator Control Panel.”

RMI Library Operation

It is recommended that the Remote Management Interface (RMI) be used as the primary library interface because the web interface is easier to use, provides access to additional features, and includes online help. The RMI is not required to use the product. It does, however, enabled you to configure advanced features, such as SNMP, IPv6, encryption, and partitions.

Before using the RMI, you must configure the library network settings with the OCP so you can access it. This is done with the Initial Configuration Wizard (see Initial Setup Using the OCP Wizard on page 36).

For full details, see Chapter 6, “Remote Management Interface.”
**Magazine Manual Release**

The tape magazines and mailslots can be manually accessed from the front panel of the NEO XL-Series Tape Library.

To unlock an entire magazine, use a small screwdriver to press the manual release tab located at the outside edge in the center of the door hinge.

---

**Tape Cartridge Use and Maintenance**

*CAUTION:* Do not degauss LTO data cartridges! These data cartridges are pre-recorded with a magnetic servo signal. This signal is required to use the cartridge with the LTO tape drive. Keep magnetically charged objects away from the cartridge.

To ensure the longest possible life for your data cartridges, follow these guidelines:

- Use only the data cartridges designated for your device.
- Clean the tape drive only when the Clean Drive LED is illuminated using only a Ultrium Universal Cleaning Cartridge.
- Do not drop a cartridge. Excessive shock can damage the internal contents of the cartridge or the cartridge case itself, making the cartridge unusable.
- Do not expose data cartridges to direct sunlight or sources of heat, including portable heaters and heating ducts.
- The operating temperature range for data cartridges is 10 to 35°C. The storage temperature range is -40 to +60°C in a dust-free environment in which relative humidity is always between 20 percent and 80 percent (non-condensing).
- If the data cartridge has been exposed to temperatures outside the specified ranges, stabilize the cartridge at room temperature for the same length of time it was exposed to extreme temperatures or 24 hours, whichever is less.
- Do not place data cartridges near sources of electromagnetic energy or strong magnetic fields such as computer monitors, electric motors, speakers, or X-ray equipment. Exposure to electromagnetic energy or magnetic fields can destroy data and the embedded servo code written on the media by the cartridge manufacturer, which can render the cartridge unusable.
- Place identification labels only in the designated area on the cartridge.
Labeling Tape Cartridges

The device contains a barcode reader that reads the tape labels and stores the inventory data in memory. The device then provides the inventory information to the host application, OCP, and RMI. Having a barcode label on each tape cartridge enables the barcode reader to identify the cartridge quickly, thereby speeding up inventory time. Make it a practice to use barcode labels on your tape cartridges.

A proper barcode label includes the media ID in the last two characters of the barcode. The library will not load an incompatible cartridge, based on the barcode media ID, into a tape drive. For example, the library will not load a cartridge labeled as LTO-3 into an LTO-6 tape drive. This saves the time needed to load the cartridge and have the tape drive reject it.

Your host software may need to keep track of the following information via the associated barcode:

- Date of format or initialization
- Tape's media pool
- Data residing on the tape
- Age of the backup
- Errors encountered while using the tape (to determine if the tape is faulty)

**IMPORTANT:** Misusing and misunderstanding barcode technology can result in backup and restore failures. Use only high quality labels. Self-printed labels are not recommended as they are often a source of barcode reading issues.

LTO tape cartridges have a recessed area located on the face of the cartridge next to the write-protect switch. Use this area for attaching the adhesive-backed barcode label. Only apply labels as shown:

**IMPORTANT:** The barcode label should only be applied as shown, with the alphanumeric portion facing the hub side of the tape cartridge. Never apply multiple labels onto a cartridge because extra labels can cause the cartridge to jam in a tape drive.
Write Protecting Tape Cartridges

All rewritable data cartridges have a write-protect switch to prevent accidental erasure or overwriting of data. Before loading a cartridge into the device, make sure the write-protect switch on the front of the cartridge is in the desired position.

Switch positions:
- Slide the switch to the left to allow the device to write data to the cartridge.
- Slide the switch to the right to write-protect the cartridge. An indicator, such as a red mark or small padlock, is visible showing that the cartridge is write-protected.
The Base Module front Operator Control Panel (OCP) panel has an LCD display, with a power button, five LEDs, and an USB port below the display. From the OCP, you can monitor, configure, and operate most library functions.

The OCP screen provides a similar set of menu items as compared to the full capability of the RMI (see Chapter 6, “Remote Management Interface”).

Topics in Operator Control Panel:
- OCP Layout
- Change Settings Procedure
- Configuration Menu
- Maintenance Menu
- Operation Menu
- Status Menu
- Logout

OCP Layout

NOTE: The OCP screen is identical to the RMI layout with the exception of the OCP Right Pane is the same as the RMI Center Pane and the RMI Right Pane is not shown in the OCP. Also, some RMI functions and options are not available in the OCP.
The OCP screen consists of three areas:

- **Top Banner** – Current status and information.
- **Left Pane** – Library and module status overviews.
- **Right Pane** – Library details and buttons to access features and options.

**OCP Home Page Element Details**

**Top Pane**
- **Home Icon** ( ) – Press the Home icon to return to the main screen.
- **Library Health Icon** – An icon indicating the overall health status of the library.
  - **Status OK Icon** ( ) – The green check mark icon indicates that all library components are fully operational and that no user intervention is required.
  - **Warning Status Icon** ( ) – The yellow triangle exclamation point icon indicates that user attention is necessary but that the library can still perform most operations. Press the icon to display the event ticket log.
  - **Error Status Icon** ( ) – The red circle X icon indicates that user intervention is required and the library is not capable of performing some operations. Press the icon to display the event ticket log.
- **Status** – The status of the library robotics.
  - **Idle** – The library robotics is ready to perform an action.
  - **Moving** – The library robotics is moving a cartridge.
  - **Scanning** – The library robotics is performing an inventory of cartridges.
  - **Offline** – The library robotics has been taken off line by the library.
- **Library Time & Date** – Helpful information when analyzing event logs and support tickets, and might be needed when contacting support.
- **Logout** ( ) – Logs out of this RMI session and changes view to Login screen.

**Left Pane**
- **Serial #** – The serial number of the Base Module.
- **Hostname** – The library hostname.
- **IPv#** – The IP version (IPv4 or IPv6) and IP address.
• **Firmware** – The library firmware version.
• **Module Status Overviews** – A summary of each module’s configuration and health. Click the module status area to select a different module.
  • **Module Health Icon** – An icon that indicates the health of the library (green OK, yellow warning, or red error).
  • **Module Number** – Modules are numbered based on their location in the physical library starting with the bottom module as Module 1. The Base Module is annotated with (Base).
• **Drive Status** – The number of drives installed in the module, the health of each drive (color code), and a bar indicating the drives installed. Click the drive bar rectangle to display the drive configuration and status information pop-up.
  • **Black Rectangle** - indicates that the drive is fully operational and that no user intervention is required.
  • **Yellow Rectangle** - indicates that user attention is necessary but that the drive can still perform most operations.
  • **Red Rectangle** - indicates that user intervention is required or that the drive is not capable of performing some operations.
• **Magazine Slot Usage** – The slot number in use / total number of cartridge slots available. Click the slot bar on the right to display cartridge inventory and status information (**Status > Cartridge Inventory > List View**).
• **Drive Status** – The current drive activity for each drive in the module. The drive operation status is only displayed for the selected module. Click the drive icon to display the drive configuration and status information pop-up. The text below the icon is the current status:
  • **Write** – The drive is performing a write operation.
  • **Read** – The drive is performing a read operation.
  • **Idle** – A cartridge is in the drive but the drive is not performing an operation.
  • **Empty** – The drive is empty.
  • **Encrypt** – The drive is writing encrypted data.

**Right Pane**
• **Open Mailslot** – Click to unlock the mailslot on the selected module. Refer to **Open Mailslot on page 115** for details.
• **Open Magazine** – Click to unlock a magazine in the selected module. Only one magazine in the library can be open at a time. Refer to **Open a Magazine on page 115** for details.
• **Configuration** – Click to configure the library. See **RMI Configuration Options on page 80**.
• **Maintenance** – Click to access maintenance functions. See **RMI Maintenance Options on page 102**.
• **Operation** – Click to access operation functions. See **RMI Operation Options on page 113**.
• **Status** – Click to access status information. See **RMI Status Options on page 117**.
LED Indicators

There are five LED indicators to the right of the Power button.

<table>
<thead>
<tr>
<th>LED</th>
<th>Color</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>UID</td>
<td>Blue</td>
<td>The Unit Identification (UID) LEDs are controlled by the user through the action <strong>Turn Identifier Light On or Off</strong> from the maintenance screen of the OCP. The UIDs on the OCP and Base Module back panel are activated and deactivated together. The UIDs are helpful for locating components of the library in a data center.</td>
</tr>
<tr>
<td>Ready</td>
<td>Green steady</td>
<td>Library power is ON.</td>
</tr>
<tr>
<td></td>
<td>Green flashing</td>
<td>Blinking when there is tape drive or library robotic activity.</td>
</tr>
<tr>
<td>Clean</td>
<td>Amber</td>
<td>A tape drive cleaning operation is recommended.</td>
</tr>
<tr>
<td>Attention</td>
<td>Amber blinking</td>
<td>The library has detected a condition for which user attention is necessary, but that the library can still perform most operations.</td>
</tr>
<tr>
<td>Error</td>
<td>Amber</td>
<td>An unrecoverable tape drive or library error occurs. A corresponding error message is displayed on the OCP screen. User intervention is required; the library is not capable of performing some operations.</td>
</tr>
</tbody>
</table>

**NEOxl 80 OCP Menu**

The OCP Home screen has six menu categories that are covered in detail in this chapter.

The OCP provides a subset of menu items compared to the full capability of the RMI.

- Open a Mailslot
- Open a Magazine
- Configuration [see Configuration Menu]
  - System
    - Save/Restore Configuration
    - Date/Time Format
    - Media Barcode Compatibility Check
    - Allow Unlabeled Media
Log Into The Library (via OCP)

To log in to the library using the front panel OCP:

1. If the OCP screen saver is on, press **Enter** to display the **Login** screen.
2. From the drop-down **User** list, select the type of **user**.

3. If required, enter the **PIN**.

4. Press the **Login** button.

**Change Settings Procedure**

The OCP is a color touchscreen that you navigate using the on-screen buttons. Blue buttons indicate active options for the type of user selected.

- To make changes, press an option button. A subscreen opens with more option/procedural buttons and information.
- To return to a higher level of options, press one of the option buttons at the top of the screen or the **Cancel** button.
Configuration Menu

Press the **Configuration** button on the Home screen.

The Configuration Menu provides the following submenus:

- **System**
- **Mailslots**
- **Drives**
- **Network**
- **User Accounts**
- **Configuration Wizard**

**System**

The OCP **Configuration > System** screen has these options:

- **Save/Restore Configuration** – Save the library configuration settings to a file or restore the settings. Also permits the resetting of the library, the list of known drives and modules, and the hardware configuration.
- **Date/Time Format** – Choose a timezone, format, and current settings for the time and date.
- **Media Barcode Compatibility Check** – Enable or disable the checking of media barcodes.
- **Allow Unlabeled Media** – Allow or disallows unlabeled media.

**Save/Restore Configuration**

From the **Configuration > System > Save/Restore Configuration** screen you can save the library configuration settings to a file, restore the settings, or reset the library configuration to the default settings. The saved configuration database will make it easier to recover the library configuration if you need to replace the Base Module or Base Module controller.
To save a configuration file:

1. Navigate to Configuration > System > Save/Restore Config.
2. If necessary, press the Save Configuration File bar to open it.
3. Insert a USB flash drive into one of the USB ports on the Base Module.
5. When the option buttons appear, press Download.
   When done, a confirmation screen briefly appears and then you are returned to the
   Save/Restore screen.

To restore a previously saved configuration file:

   NOTE: When restoring the configuration file from a USB device, copy the configuration file you want
to restore onto the USB device and remove any other configuration files from the USB device.

1. Navigate to Configuration > System > Save/Restore Config.
2. Press the Restore Configuration File bar to open it.
3. Insert a USB flash drive containing the previously saved configuration into one of the USB ports on the Base Module.
4. Press the Upload File & Restore button that appears in the Restore section.
   This starts the uploading process and restores the configuration file from the system
   running the RMI. A messages show the upload and library reboots. Once the library
   comes back online, you need to log back into the OCP.

To reset the library configuration to its default settings:

1. Navigate to Configuration > System > Save/Restore Config.
2. Press the Reset Default Settings bar to open it.
3. Press Reset Default Settings.
   For information on the default settings, see Default Settings on page 197 in Appendix C,
   “Technical Specifications.”

To reset the List of Known Drives and Modules:

1. Navigate to Configuration > System > Save/Restore Config.
2. Press the Reset the List of Known Drives and Modules bar to open it.
3. Press Reset.
   This feature does a re-discovery of installed hardware components. During this
   discovery, any modules and drives that are no longer in the library stack are removed
   from the list.

To reset the hardware configuration:

1. Navigate to Configuration > System > Save/Restore Config.
2. Press the Reset Hardware Configuration bar to open it.
3. Press Reset.

Date/Time Format

   NOTE: The library does not adjust its time for daylight savings time. The time must be adjusted
   manually.
To configure date and time format parameters and use an SNTP server, navigate to
Configuration > System > Date and Time Format.

To set the time zone for the library clock:

1. If necessary, press the Time Zone bar to open the option.
   A list of continents, countries, and regions is displayed.

2. To select a location from the list:
   a. Touch the left list of the three lists shown.
      A larger version of the list is shown for easier selection.
   b. Select a location from the list displayed.

   **NOTE:** When an item is proceeded with a greater than (>) symbol (for example, > America),
   when it is selected, a submenu of locations is displayed in the next column.

   c. If an expanded time zone list is shown in the next column, repeat Step b until a location with
      the appropriate time zone is visible (no “>”) and select that location.

3. Press Submit.

To set the date and time formats:

1. Press the Date/Time Format bar to open the option.

2. From the drop-down list, select a Time Format.
   Choose either **12 hours (hh:mm:ss am/pm)** or **24 hours (hh:mm:ss)**.

3. From the drop-down list, select a Date Format.
   For example, depending on the format selected, June 30, 2018 is displayed as:
   - **DD.MM.YYYY** – “30.06.2018”
   - **MM/DD/YYYY** – “06/30/2018”
   - **YYYY-MM-DD** – “2018-06-30”

4. Press Submit.

To set the library clock to the current date and time:

1. Press the Set Date/Time bar to open the option.

2. Enter the time in the selected format.
   Refer to Step 3 in the previous procedure.

3. Touch the Date field and use the calendar that appears to choose the current date.

4. Press Submit.
To set the library clock using an SNTP server:

**NOTE:** The library must have network access to an SNTP (Simple Network Time Protocol) server to set the library clock using an SNTP server.

1. Press the **SNTP** bar to open the option.

![SNTP Configuration](image)

2. Check the **SNTP Enabled** box.

3. Touch the **SNTP Server** field and enter the **SNTP Server** IP address.

4. Press **Submit**.

**Media Barcode Compatibility Check**

To enable or disable the barcode media ID check, navigate to **Configuration > System > Media Barcode Compatibility Check**. The default is enabled. To disable, uncheck the option box and press **Submit**.

When the **Barcode Media ID Restriction** box is checked, the library only allows tape cartridges with the appropriate barcode media ID (the last two characters of the barcode) to be loaded into tape drives. For example, an LTO-8 labeled cartridge is not allowed to be moved into an LTO-7 tape drive.

When disabled, the library moves any tape into any tape drive. If the cartridge is incompatible with the tape drive, the library displays an error message.

**NOTE:** It is strongly recommended that ALL cartridges have barcode labels with the correct media ID, and that the Barcode Media ID Restriction is enabled.

**Allow Unlabeled Media**

To allow or disallow cartridges without labels from being used in the library, navigate to **Configuration > System > Allow Unlabeled Media**. The default is disallowed. To allow, check the option box and press **Submit**.

**Mailslots**

The **Configuration > Mailslots** screen has these options:
The OCP Configuration > Mailslots screen lists each of the mailslots and shows the status.

To change a mailslot state, press the status button on the far right for the appropriate mailslot and then press Submit. Slots not enabled as mailslots are available as storage slots.

To determine the automatic mailslot relock time, using the drop-down menu, select either 30 seconds (default) or 5 minutes, and then press Submit.

Drives

Use the OCP Configuration > Drives screen to view and modify drive settings.

Drive information is shown in the option bar:

- **Drive number** – Drives are numbered from the bottom of the library up beginning with one. The drive currently hosting the SCSI communication for the library is designated with (LUN).
- **Serial Number (S/N)** – The serial number assigned to the tape drive by the library. This serial number is reported to host applications. The serial number cannot be modified.
  
  This is not the serial number assigned to the drive by the manufacturer. That serial number is shown in Manufacturer S/N.
- **LTO generation** – The supported version of the LTO drive:
  - LTO-5 – LTO-5 Ultrium Tape Drive
  - LTO-6 – LTO-6 Ultrium Tape Drive
  - LTO-7 – LTO-7 Ultrium Tape Drive
  - LTO-8 – LTO-8 Ultrium Tape Drive
- **Drive form factor**:
  - HH – Half height
  - FH – Full height
- **Drive interface**:
- FC – Fibre Channel
- SAS – Serial Attached SCSI
- (Modified) – When this text is present, it indicates that one or more settings have been changed. To apply the changes, press Submit. To reset all changed fields to their previously saved values, press Undo.
- **Power Status (Pwr)** – Indicates whether the drive is currently powered ON or OFF.

Additional information is shown below the option bar:
- **Firmware** – The version of firmware currently installed on the drive.
- **Manufacturer S/N** – The serial number assigned to the drive when it was manufactured. Use this serial number when working with Technical Support.

**Configurable options:**
- **Power On** – Box is checked when the drive is ON. Uncheck the box to power off the drive.

**NOTE:** Always power off a tape drive before removing it from the library or moving it to a new location within the library.

To apply the changes, press Submit. To reset all changed fields to their previously saved values, press Undo.

**Network**

The OCP Configuration > Network option is used to configure the following items:
- General Network Settings
- Primary Network Port
- Secondary Network Port
- Reset Internal IP Range

**General Network Settings**

The Host Name and Domain Name that was configured with the Initial Configuration wizard are used to access the RMI is in the form:

"<Host Name>.<Domain Name>"

To change these settings:

1. Navigate to the Configuration > Network screen.
2. At the top, update the **Host Name** and **Domain Name**.
3. Press Submit.

**Primary Network Port**

Use these settings to change the primary port’s configuration.

1. With the Primary Network Port option opened, use the two drop-down menus to select the following:
   - **Protocol** – Select either IPv4, IPv6, or IPv4 & IPv6.
   - **Max. Link Speed** – Select either 10 Mbit, 100 Mbit, or 1 Gbit (default).
2. Based on the Protocol setting selected, use the IPv4 and/or IPv6 sections to configure the protocol settings.
   To have the library obtain an IP address from a DHCP server instead of a Static IP address, select the DHCP (IPv4) or Stateless (IPv6) method.

3. Press Submit.

Secondary Network Port

If a secondary network port is used, open the Secondary Network Port option, check the Port Enabled box, and configure the same options as used for the Primary Network Port.

Reset Internal IP Range

**NOTE:** Only reset the internal IP range if you are using the same range in your network environment.

To reset the internal IP range, open the Reset Internal IP Range (in case of conflict) bar and press Submit.

For internal communication between modules the tape library uses an Ethernet connection with an internal IP address range. To prevent any conflict between the internal IP address range and the external IP addresses, it is necessary to select the internal IP range before the tape library gets connected to the external Ethernet port.

A file which contains the internal IP range is stored on the Base Module backplane (/opt/storage/mfg/stack/network.range and LCM /opt/storage/configuration/network.range).

The file is created through the OCP IP Range selection screen when the NEO starts for the very first time or if the library is reset to Manufacturing Defaults. The file can be reset via either OCP or RMI.

The Values must be in the following format:

```
RANGE=192.0.2
```

**NOTE:** The last section of the IP address is not set because it is set internally.

User Accounts

The OCP Configuration > User Accounts screen has the following suboptions:

- Enter or change a user password.
- Restrict RMI logins.
- Allow mailslot/magazine access by regular Users.
- Lock OCP/RMI sessions to one user at a time.

To set or change user passwords:

The supported user types are:

- **User** – This account allows access to only the library status information and does not allow access to configuration, maintenance, or operation features. A password is not required for the user account. Setting a user password restricts access to even the status information. The library initially has no User password.

- **Administrator** – Setting an administrator password provides restricted access to the administrator functions of the RMI. The library initially has a default administrator password adm001.

1. At the top of the screen, use the drop-down menu to select either User or Administrator.
2. Touch the **New Password** field and enter a password.
   The password must contain 8-16 characters, which can include upper- and lower-case letters, numbers, and special characters.

3. Touch the **Repeat Password** field and reenter the password.

4. Press **Submit**.

**To restrict RMI logins:**

The Administrator can set login restrictions for Administrator login. If the restriction mode is enabled, an Administrator is not allowed to login via RMI. The Administrator can only disable the restriction mode through the OCP. Only the Administrator is allowed to set and reset the restricted RMI login.

Touch to check the **Restricted Remote Management Interface (RMI) Login** box and press **Submit**.

**To allow mailslots or magazines to also be accessed by regular Users:**

Touch to check the boxes to allow regular Users access to the mailslots and magazines and press **Submit**.

**To lock OCP/RMI sessions to one user at a time:**

Touch to check the **OCP/RMI Session Locking** box and press **Submit** to allow only one OCP or RMI session at a time by an Administrator.

### Configuration Wizard

The Initial Configuration wizard guides you through setting up the library network configuration, configuring the date and time, and setting the administrator PIN. You can skip items and stop the wizard at any time. When you have configured the network settings, you can initiate the wizard from the RMI to complete the remaining configurations.

**NOTE:** On the very first power up of the library, the user is prompted to run the Initial Configuration wizard. It is recommended to go completely through the wizard and finish the initial configuration by choosing **Finish**. Otherwise, with every login on the OCP screen, the user is prompted again to go through the wizard.

Once the network settings have been configured, you can initiate the wizard from the RMI to complete the remaining settings. The very first time you use the RMI, logon as the User “**administrator**” with the default administrator password “**adm001**”.

### Maintenance Menu

Press the **Maintenance** button on the Home screen.
The Maintenance Menu provides the following submenus:

- Software Upgrades
- View Logs
- Download Logs
- System Reboot
- Library Test
- UID LED Control
- Move Robot to Base Module
- Support Information

**Software Upgrades**

Library and drive firmware can be upgraded to the latest version. Customization of the library is also available from this screen.

The OCP **Maintenance > Software Upgrades** screen has these options:

- System Firmware
- Drive Firmware
- Customization

**System Firmware**

The firmware version currently installed on the library is displayed on this screen.

To update library firmware from the OCP:

1. Insert a USB flash drive containing the firmware file (.FBI) into one of the USB ports.
2. Press **Upgrade from USB**.

**NOTE:** When you update the library firmware, the library also updates the firmware of any expansion modules to a compatible version.
**Drive Firmware**

Drive firmware can be updated on multiple drives of the same type at the same time. Each drive only accepts the appropriate firmware for that type of drive.

**NOTE:** To see the firmware version currently installed on the drives, navigate to the Maintenance > Software Upgrades > Drive Firmware screen and expand the drive option bar. The current firmware is shown in the table for those drives.

**To update drive firmware from the OCP:**

**NOTE:** Only one drive type at a time can be selected for upgrading its firmware.

1. Insert a USB flash drive containing the **drive firmware file** into one of the USB ports.
2. Navigate to the Maintenance > Software Upgrades > Drive Firmware screen.
   The tape drives are organized by drive type.
3. Touch the appropriate drive type option bar to expand it and select one or more of the **tape drives** of that type to update.
   To select all drives of that type, touch the box on the left in the table title bar.
4. Press **Next**.
5. Press **Choose File**, and then select the **file** from the USB.
6. Press **Submit**.

**Customization**

**IMPORTANT:** This option is for Factory use only.

Insert a USB flash drive containing the **customization file** into one of the USB ports and press Start Customization.

**View Logs**

To view the library log files, navigate to the Maintenance > View Logs screen.

Use the drop-down menu on the right to choose a **type of log**. Available log types are:

- **Event Ticket Log** – Records library error and warning events. The log entries contain a ticket number, date and time code, event code, description, current event state, component type, component identifier, and severity.
- **Information Log** – Records library information warnings. The log entries contain a date and time code, event code, and description.
- **Configuration Log** – Records configuration changes. The log entries contain a date and time code, event code, and description.

The log entries are displayed in order of most recent to oldest. By default, only open logs are shown. To include closed logs, press Include Closed Tickets. To close all the open logs, press Close All Open Tickets. Press Clear Log to remove all events in the Event Ticket log.

The selected log entries are shown in a table using the following layout:

<table>
<thead>
<tr>
<th>Ticket-No.</th>
<th>Time</th>
<th>Event</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>State</td>
<td>Component</td>
<td>Component ID</td>
<td>Severity</td>
</tr>
</tbody>
</table>
The format for the Time code is:

- **DD.MM.YYYY** (Day. Month. Full_Year)
- **HH.MM.SS** (Hour. Minute. Second)

To scroll the list, either press or press-and-hold the Up and Down arrows in the scroll bar on the right side of the table.

**To view a specific log:**

1. Select a **log type** from the drop-down list.
2. Scroll down the log table to locate the **log**.
3. Press the log table **entry** to open a viewing pane.
   - If desired, press Close Ticket to close that entry.
   - Otherwise, press Close to close the viewing pane.

**Download Logs**

**NOTE:** Only one drive at a time can be selected for downloading its log.

From the OCP Maintenance > Download Logs screen you can download a support ticket from the library or any of the tape drives.

**To download a drive log:**

1. If necessary, expand the Drive Logs list by touching the option bar.
   The list displays:
   - **Drive** – The drive number. Drives are numbered starting with the one at the physical bottom of the library up to the top.
   - **Type** – The drive manufacturer, LTO version, form factor (half height or full height), and interface (FC or SAS).
   - **Firmware** – The current drive firmware version number.
   - **Serial** – The drive serial number.
   - **Module** – The module containing the tape drive.
   - **Partition** – The logical library associated with the tape drive.
2. Select a drive by pressing the box next to it.
   Selecting a different drive clears the previous drive selection.
3. Once a drive is selected, use the drop-down menu above the table title bar to select the type of log (DMP file) to download:
   - **Regular Dump** – This option downloads a regular dump file for the tape drive.
   - **Forced Dump** – This option downloads a forced dump file for the tape drive.
4. Press **Save**.
   The process may take up to 10 minutes. When done, the **Download** and **Cancel** buttons appear.
5. Press **Download** and select whether to open or save it.

**To download a library log:**

1. Expand the Library Logs list by touching the option bar.
2. Press **Save**.
System Reboot

To reboot the library from the OCP, navigate to the Maintenance > System Reboot screen and then press Reboot.

This starts the reboot process with messages showing as the library reboots. Once the library comes back online, you need to log back into the OCP.

Library Test

The OCP Maintenance > Library Test screen has these options:

- System Test
- Slot-to-Slot Test
- Wellness Test
- Robotic Test
- OCP Test

System Test

The System Test exercises overall library functionality by moving cartridges within the library.

- During each cycle the library moves a cartridge from a full slot to an empty drive and then returns it to its original slot. You can select the number of cycles for the test. If the test is canceled, the library returns the cartridge to its original slot.
- The library does not move cleaning cartridges during the test.
- The test operates over the whole library and does not take into account partition configuration.
- During the test the library is offline.

To run the test:

1. Navigate to the Maintenance > Library Test > System Test screen.
2. Select the number of cycles.
3. For the media, select if it is a Seating or Threading test.
4. Press the Start Test button that appears.

Slot-to-Slot Test

The Slot-to-Slot Test randomly exchanges cartridges between slots to verify that the library is operating correctly.

- At the end of the test the cartridges are NOT returned to their original slots.
- If a tape is moved to an incompatible drive, the drive will reject the tape, as designed.
- The test operates over the whole library and does not take into account partition configuration.
- During the test the library is offline.

**NOTE:** For service and diagnostics, use the Robotic Test (see Robotic Test on page 62).

To run the test:

1. Navigate to the Maintenance > Library Test > Slot-to-Slot Test screen.
2. Select the **number of cycles**.
3. Press the **Start Test** button that appears.

**Wellness Test**

The **Wellness Test** exercises a general health check on library functionality by running the following partial tests:

- Basic Hardware Review
- Robotics Initialization
- Barcode Scanning Test
- Magazine/Mailslot Unlock Motor Test
- Move Media Test

Running the test requires each module to have:

- At least one enabled and functional drive.
- One cartridge with a barcode label.

After the test has been started, the **Stop Test** button is active. Pressing the button aborts the **Wellness Test** but not before the current partial test has been completed.

- The test operates over the whole library and does not take into account partition configuration.
- During the test the library is offline.

The **Info** column notifies the user about the status and result of each partial test (**Info** and **Done** columns in table).

**To run the test:**

**NOTE:** For quickest test execution, it is recommended to have one functional drive in each module and eight compatible cartridges in the corner slots of the same module.

1. Navigate to the **Maintenance > Library Test > Wellness Test** screen.
2. Press **Start Test**.

**Robotic Test**

The **Robotic Test** exercises all Robotic Assembly movements and sensors. During the test the library is offline.

**To run the test:**

1. Navigate to the **Maintenance > Library Test > Robotic Test** screen.
2. Press **Start Test**.

**OCP Test**

The **Maintenance > Library Test > OCP Test** exercises functionality of the front panel LEDs or resets the contrast and brightness of the OCP LCD display.

To start a test/reset, select it from the drop-down menu, and press **Start**.

- **LED Test** – Switches every LED on/off sequentially left to right and right to left. During the test, the library is offline.
• **Touch Panel Calibration** – The TSLIB Utility runs that calibrates the touchscreen. Press each of the five cross-hairs (four corners and center) that appear. When done, you must log back into the OCP.

**UID LED Control**

The UID LEDs are a pair of blue LEDs—one on the front OCP and the other on the Base Module controller in the rear. The UID LEDs are useful for identifying the library in a data center. From the OCP **Maintenance > UID LED Control** screen, you can toggle the status ON and OFF.

To select and switch on the UID LEDs:

1. Navigate to the OCP **Maintenance > UID LED Control** screen.
2. Select the **components** where you want to switch on the UID LEDs.
3. Press **On** and then press **Submit**.
4. When done, press **Off** and then press **Submit**.

**Move Robot to Base Module**

Before extending or removing a module from the rack, the Robotic Assembly must return to its park position in the Base Module.

**NOTE:** Under normal circumstances, when the library is powered off using the front power button, the robot automatically parks and locks in the Base Module behind the OCP.

If the library did not move the Robotic Assembly to its park position, you can do so from the OCP **Maintenance > Move Robotic to Base Module** screen.

To move the robotic assembly back to the Base Module:

1. Navigate to the OCP **Maintenance > Move Robot to Base Module** screen.
2. Press **Submit**.
   - Look inside the Base Module window to verify that the Robotic Assembly is behind the OCP.

**Support Information**

The **Maintenance > Support Information** screen shows how to obtain technical support for your NEO Tape Library either online or via telephone.
Operation Menu

Press the **Operation** button on the Home screen.

The Operation button provides the following submenus:

- **Move Media**
- **Clean Drive**
- **Open Mailslot**
- **Open Magazine**
- **Rescan**
- **Force Drive Media Eject**
- **Unlock Multiple Magazines**

**Move Media**

Using the OCP **Operation > Move Media** screen, you can move a tape cartridge located in a source element to an available destination element within the same partition (for example, from a mailslot to a drive).

- **Source Elements** – Enabled mailslots, tape drives, and storage slots (in that order) that contain a tape cartridge.
- **Destination Elements** – Enabled mailslots, tape drives, and storage slots that are empty.

Tape drives are listed in numeric order starting with the bottom drive and going upwards.

Mailslots and regular slots are listed in the order of the slot numbers. Slots are numbered \( m.s \), where \( m \) is the module number and \( s \) is the slot within the module.

To move media between elements in the library:
NOTE: Use the arrow icons on the right to scroll the Element list one screen at a time and the double-arrows to move to the top or bottom of the list. Pressing the plus (+) magnifying glass icon expands the list to fill the screen; the minus (-) version returns you to the normal list screen.

1. Navigate to the Operation > Move Media screen.
2. If necessary, select Source at the top of the screen.
3. Select the Source Type.
   Choose from Slot, Drive, Mailslot, or Barcode.
4. Press to select the source Element in the list.
   The selection appears in the Source field at the top right.
5. At the top, press Destination.
6. Select the Destination Type.
   Choose from Slot, Drive, or Mailslot.
7. Press the destination Element in the list.
   The selection appears in the Destination field at the top right.
8. Press Submit.
   A Move in Progress message is shown and the robotics assembly can be seen moving.

Clean Drive

NOTE: Use the arrow icons on the right to scroll the Element list one screen at a time and the double-arrows to move to the top or bottom of the list. Pressing the plus (+) magnifying glass icon expands the list to fill the screen; the minus (-) version returns you to the normal list screen.

From the OCP Operation > Clean Drive screen you can initiate a drive cleaning operation.

1. Navigate to the OCP Operation > Clean Drive screen.
2. If necessary, select Source at the top of the screen.
   A list of elements containing cleaning cartridges is shown.
   
   NOTE: The library uses the barcode label (CLNxxxxx) to identify cleaning cartridges. If no cleaning cartridges are available, load one using a mailslot or magazine slot.
3. Select a cleaning cartridge from the Source Elements list.
   The selection appears in the Source field at the top right.
4. At the top, press Destination.
5. Select the tape drive to be cleaned from the Destination Elements list.
   The selection appears in the Destination field at the top right.
   
   NOTE: Tape drives currently containing a cartridge are not listed. To clean a tape drive not listed, move the cartridge out of the drive.
6. Press Submit.

Open Mailslot

NOTE: To open more than one mailslot, open one and then the other.
From the OCP Operation > Open Mailslot screen you can see the status of and unlock any enabled mailslot in the library.

To open a mailslot, press Open for the appropriate mailslot. The library releases the lock and you can then pull the mailslot out of the library to access it.

**NOTE:** The mailslot relocks after 30 seconds (or 5 minutes if so configured) if it is not opened.

For information about manually opening a mailslot, see Magazine Manual Release on page 41. The mailslot must be enabled before it can be opened. To enable a mailslot, see Mailslots Configuration on page 94.

**Open Magazine**

**NOTE:** Only one magazine can be opened at a time.

From the OCP Operation > Open Magazine screen you can unlock any magazine in the library. The magazines are shown in a table by Module number, both Left and Right. The table shows the current status and the button below the status is labeled with the opposite action. For example, a magazine can say “Closed” and Open is shown below.

To unlock a magazine, press Open for the appropriate magazine. The library releases the lock. You can then pull the magazine out of the library to access the storage slots.

**NOTE:** Opening a magazine takes the library offline. If not opened, the magazines relock after 30 seconds (or 5 minutes if so configured).

For information about manually opening a magazine, see Magazine Manual Release on page 41.

**Rescan**

To have the library rescan the cartridges, navigate to the OCP Operation > Rescan Inventory screen and press Rescan. The library changes to Scanning (Offline) status and is unavailable to perform other operations until the scan is complete. This can take several minutes.

**Force Drive Media Eject**

The Force Drive Media Eject operation attempts to force the tape drive to eject the cartridge and place it into an open slot. Access to this feature requires the administrator password.

**NOTE:** If the drive has difficulty ejecting the cartridge, the media is possibly bad or damaged.

Before performing this option, it is recommended that you attempt to eject the tape using the backup software or library Move Media operation. While a drive is being force ejected, a window indicating the process is ongoing should appear. No operations are available until the force eject completes.

**NOTE:** Use the arrow icons on the right to scroll the Element list one screen at a time and the double-arrows to move to the top or bottom of the list. Pressing the plus (+) magnifying glass icon expands the list to fill the screen; the minus (-) version returns you to the normal list screen.

1. Navigate to the OCP Operation > Force Drive Media Eject screen.
2. If necessary, select Source at the top of the screen.
   A list of drives containing media is shown.
3. Select a drive from the Source Elements list.  
   The selection appears in the Source field at the top right.

4. At the top, press Destination.

5. Select an element from the Destination Elements list.  
   The selection appears in the Destination field at the top right.

6. Press Submit.

Unlock Multiple Magazines

NOTE: Only one magazine can be opened at a time.

A wizard is provided to unlock multiple magazines, programmed to open one after the other.  
This simplifies loading and unloading multiple cartridges at one time. If you need to, you can press Cancel at any time.

1. Navigate to the OCP Operation > Unlock Multiple Magazines screen.

2. Using the Back and Next buttons, select the magazines and the order you want them opened.

3. When done, press Finish to start the process.
   Once started, you have 20 seconds to open a magazine. When that magazine is closed,  
   the next 20 seconds start. Failure to open a magazine within the 20 seconds aborts the procedure.

Status Menu

To view the status the NEO Tape Library and its components with the OCP, press the Status button on the Home screen.
The Status Menu provides the following submenus:

- Library Status
- Cartridge Inventory
- Partition Map
- Drive Status
- Network Status

### Library Status

A summary of library information and status is displayed in the Left Pane. For additional library module configuration and status information navigate to the OCP Status > Library Status screen.

There are three areas on this screen:

- Library Information
- Library Status
- Module Status

### Library Information

If necessary, touch the option bar to view the following items listed in this section.

- Vendor
- Product ID
- Serial Number – Library serial number.
- Firmware Revision – Version of the currently installed library firmware.
- Robotic Hardware Revision
- Robotic Firmware Revision – Version of the currently installed Robotic Assembly firmware. The Robotic Assembly firmware is bundled and installed with the library firmware.
- Barcode Reader Hardware Revision
• **Barcode Reader Firmware Revision** – Version of the currently installed barcode reader firmware. The barcode reader firmware is bundled and installed with the library firmware.

• **WWide Node Name** – World Wide Node Number.

**Library Status**

If necessary, touch the option bar to view the following items listed in this section.

• **Library Status** (matches the status in the **Top Banner**).
  - **Idle** – The library robotic is ready to perform an action.
  - **Moving** – The library robotic is moving a cartridge.
  - **Scanning** – The library robotic is performing an inventory of cartridges.
  - **Offline** – The library robotic has been taken offline by the library.

• **Total Power On Time** – Total time that the Base Module has been powered on since it was manufactured.

• **Cartridge in Transport** – When applicable, displays the barcode label of the cartridge currently in the Robotic Assembly.

• **Odometer** – Robotic assembly move count.

• **Robotic Location** – Displays the module where the robotic is currently located.

• **Shipping Lock** – Indicates whether the robotic is unlocked or locked for shipment.

**Module Status**

Each installed module shows an individual status. If necessary, touch the option bar to view the following items listed in this section.

• **Base/Expansion Controller Revision** – Hardware revision of the controller board currently installed in the module selected.

• **Power Supply Status** – Displays the status of power redundancy.

• **Lower Power Supply Fan** – Displays the status of the power supply fan in the lower PSU bay.

• **Upper Power Supply Fan** – Displays the status of the power supply fan in the upper PSU bay.

• **Left Drive Power Board** – Status of the Drive Power Board (DC-DC converter) for the drive slots in the module.

• **Right Drive Power Board** – Status of the Drive Power Board (DC-DC converter) for the drive slots in the module.

• **Chassis Fan** – Shows the status of the cooling fan for the chassis.

You can press **Refresh** to update the statuses.

**Cartridge Inventory**

To see the library slots, cartridges and drives organized by module, navigate to the OCP **Status > Cartridge Inventory** screen. From there, select either **Graphical View** or **List View** of elements. Both inventory view options display each of the elements with information about any cartridge stored in the slot or drive.

**NOTE:** Cartridges stored in unused slots, which are not available for move operations, are grayed out and are not assigned to any partition.
To see a list of the elements organized by module, navigate to Status > Cartridge Inventory > List View. The default view is one of all the slot elements.

The List View displays:

- **Module** – The module number.
- **Slot #**
  - For slots, it shows the slot number (in the form m.s where m is the module number and s is the slot number) showing where the cartridge currently is located.
  - For drives, it shows the drive number (numbered from the bottom upward) showing where the cartridge currently is located.
- **Barcode** – The barcode label (if any).
- **Full** – X if a cartridge is in the slot.
- **Gen.** – LTO generation of the cartridge.
- **Partition** – The partition number.

**NOTE**: Use the arrow icons on the right to scroll the Element list one screen at a time and the double-arrows to move to the top or bottom of the list. Pressing the plus (+) magnifying glass icon expands the list to fill the screen; the minus (-) version returns you to the normal list screen.

The default view is cartridges in slots. The buttons at the top can filter the display by toggling the view:

- **Slots or Drives**. To limit the list to just tape drives, click Drives. Only the drive elements are show and the button changes to Slots. To return to the default slots view, click Slots.
- **Cartridges or Elements**. To limit the list to just library elements with cartridges in them, click Cartridges. To return to a full list of the elements, empty or full, click Elements.
- **Searching by Barcode Label**. To filter the list based on the barcode label, press the Search field, enter barcode characters using the pop-up keyboard, and press Search. The characters can be anywhere in the label. The search characters are not case sensitive. There are no wildcards. To disable filtering and show all the slots, press the search text in the Search field, press Back on the keyboard, and press Search.
Partition Map

To see the elements organized by partition, navigate to the OCP Status > Partition Map screen.

**NOTE:** Cartridges stored in unused slots, which are not available for move operations, are grayed out and are not assigned to any partition.

To see a list of the elements organized by partition, navigate to Status > Partition Map > List View. The default view is one of all the slot elements.

The layout and features are the same as for the Cartridge Inventory on page 69. The list grouping is by partition instead of module.
Drive Status

The OCP Status > Drive Status screen shows the configuration and status of each drive installed in the library.

Drive information is shown in the option bar:

- **Drive number** – Drives are numbered from the bottom of the library upwards.
- **Serial number** – The serial number (S/N) assigned to the tape drive by the library that is reported to host applications. The serial number cannot be modified.
- **Vendor/LTO Generation/Form Factor/Interface** – Basic drive information.
- **Library Health** – An icon indicating the overall health status of the library.
- **Drive Status** – The current drive activity.
- **Power Status** – Indicates whether the drive is currently powered ON or OFF.

If necessary, click the drive option bar to open it. The Drive Status page shows:

- **Vendor**
- **Firmware** – The version of firmware currently installed on the drive.
- **Powered** – Indicates whether the drive is currently powered ON or OFF.
- **Temperature**
- **Encryption** – Indicates whether the drive is configured for encryption using the KMIP License.
- **IP Address**
- **Module Loc** – Module Location. Shows where the drive is located to help in multiple module configurations.
- **Cooling Fan Status** – Drive cooling fan status.
- **SCSI Element Addr**
• **Personality** – Unique to OEM vendors of the tape drive. This is determined by the firmware used. It is needed should Tech Support request the info.

• **Manufacturer S/N** – The serial number assigned to the drive when it was manufactured. Use this serial number when working with Technical Support.

• **WWNN** – The drive World Wide Node Number.

• **Partition** – Number of the partition. If the partition is contains the drive currently hosting the SCSI communication for the library, it is designated with “(Library LUN).”

• **Cartridge** – The barcode of a cartridge if one is in the drive.

• **Media Removal** – Allowed or Disallowed. Many host applications prevent media removal while accessing the cartridge in the tape drive. If Disallowed, the drive is locked and the user is not able to move or unload the cartridge from the drive either through the OCP or RMI. The user must use the backup app to release the drive.

• **Data Compression** – Enabled or Disabled. Indicates whether the drive is using data compression.

• **Product ID**

After the horizontal bar, the port information is shown:

**For FC drives**:

• **Speed** – Shows 2 Gb/s, 4 Gb/s, or 8 Gb/s.

• **Port Type** – Either Loop (type) or Fabric.

• **Interface** – Shows the status of the interface such as Login complete or No light detected.

• **Loop ID / ALPA** or **Port ID**

**For SAS drives**:

• **Speed** – Shows 1.5 Gb/s, 3 Gb/s, or 6 Gb/s.

• **Interface** – Shows either Connected or Not Connected.

Click **Refresh** to update the status. Click **Expand All** to expand all partition data sections. Once expanded, click **Collapse All** to collapse all drive data sections to just option bars.

**Network Status**

The OCP **Status > Network Status** screen shows the configuration and status of the network to which the library is attached.
If necessary, touch the option bars to open them to show all the information:

- **Host Name** – Library hostname.
- **Domain Name**
- **Protocol** – IPV4 or IPv6.
- **General Network Settings**
  - **Link Status** – Enabled or Disabled.
  - **Link Speed** – The speed (Mbit/s) of the Ethernet connection to the library.
  - **Duplex** – Enabled or Disabled.
- **IPv4 settings (if used):**
  - **DHCP** – When DHCP is enabled, the library requests an IP address from a DHCP server each time the library is powered on.
  - **Address** – IP address in use by the library. If DHCP is enabled, this address was obtained from the DHCP server. When DHCP is not enabled, the address was configured (static).
  - **Netmask** – The network mask of the library controller used when DHCP is not enabled.
  - **Gateway** – The gateway used when DHCP is not enabled.
  - **DNS 1** – IP address of the primary DNS server.
  - **DNS 2** – IP address of the secondary DNS server.
- **IPv6 settings (if used):**
  - **Stateless Addressing** – When enabled, the device generates an address for itself based on the routing information obtained from a router advertisement and the MAC address. The device can manage up to five global addresses at the same time, which can be assigned from different routers.
  - **Static Addressing** – When enabled, the library uses a statically-configured address.
  - **Static Assigned Address** – The IPv6 address when Static Addressing Enabled is On.

**Logout**

Press the **Logout** button on the upper-right of the Home screen.
Remote Management Interface

The Remote Management Interface (RMI) is a web interface for NEO that provides access via a browser to all the library configurable features, includes online help, and is easier to use than the OCP. However, the RMI is not required to use the product, except to configure advanced features, such as SNMP, IPv6, encryption, and partitions.

Before using the RMI, you must use the OCP to configure the library network settings and set the administrator password. This is normally done when the library is started for the first time (see Initial Setup Using the OCP Wizard on page 36).

To start the RMI and log into the library, open the latest version of a supported HTML browser and enter the library’s IP address in the browser’s address bar. Supported browsers include Internet Explorer, Firefox, Chrome, and Safari.

**NOTE:** Check the online help in the RMI for additional information. The help pages are updated with firmware updates and often contain up-to-date technical details that might not be contained in this document. To access RMI online help, click the question mark icon (?) on the right side of the RMI top banner.

To log in remotely to the library using the RMI:

1. Open a supported web browser and enter the **IP address** of the library in the browser’s address bar.
2. From the drop-down list, select the type of **User**.
3. If required, enter the **Password**.
4. Click **Login**.

**Topics in Remote Management Interface:**

- RMI Layout
- Home Page Element Details
- RMI Configuration Options
- RMI Maintenance Options
- RMI Operation Options
- RMI Status Options
RMI Layout

The RMI Home page is organized into the following regions:

- **Top Banner** – Contains the Home, Logout, and Help (?) buttons and displays the overall status and general information about the library and user.
- **Left Pane** – Displays the library identity and module status.
- **Center Pane** – Provides access to operate and configure the library and to view additional status information.
- **Right Pane** – Displays a log of recent events (Home page default) or additional functions when a Center Pane option is selected.

Home Page Element Details

Details for the Top Banner, Left Pane, Center Pane, and Right Pane sections of the RMI default Home page.

RMI Top Banner Elements

- **Home Icon** ( ) – Click the Home icon to return to the main page.
- **Library Health** – An icon indicating the overall health status of the library.
  - **Status OK Icon** ( ) – The green check mark (✔) icon indicates that all library components are fully operational and that no user intervention is required.
  - **Warning Status Icon** ( ) – The yellow triangle exclamation point (!) icon indicates that user attention is necessary but that the library can still perform most operations. Click the icon to display the event ticket log.
  - **Error Status Icon** ( ) – The red circle X icon indicates that user intervention is required and the library is not capable of performing some operations. Click the icon to display the event ticket log.
- **Status** – The status of the library robotics.
  - **Idle** – The library robotics is ready to perform an action.
  - **Moving** – The library robotics is moving a cartridge.
• **Scanning** – The library robotics is performing an inventory of cartridges.
• **Offline** – The library robotics has been taken off line by the library.
• **Library Time & Date** – Helpful information when analyzing event logs and support tickets, and might be needed when contacting support.
• **User** – The user account logged in for this session.
• **Logout** (Logout) – Logs out of this RMI session and changes view to Login page.
• **Help** (Help) – Accesses the library online help.

**RMI Left Pane Elements**

• **Serial #** – The serial number of the Base Module.
• **Hostname** – The library hostname.
• **IPv#** – The IP version (IPv4 or IPv6) and IP address.
• **Firmware** – The library firmware version.
• **Module Status Overviews** – A summary of each module’s configuration and health. Click the module status area to select a different module.

![Module Status Overviews](image)

• **Module Health Icon** – An icon that indicates the health of the library (green OK, yellow warning, or red error).
• **Module Number** – Modules are numbered based on their location in the physical library starting with the bottom module as Module 1. The Base Module is annotated with (Base).
• **Drive Status** – The number of drives installed in the module, the health of each drive (color code), and a bar indicating the drives installed. Click the drive bar rectangle to display the drive configuration and status information pop-up.
  • **Black Rectangle** - indicates that the drive is fully operational and that no user intervention is required.
  • **Yellow Rectangle** - indicates that user attention is necessary but that the drive can still perform most operations.
  • **Red Rectangle** - indicates that user intervention is required or that the drive is not capable of performing some operations.
• **Magazine Slot Usage** – The slot number in use / total number of cartridge slots available. Click the slot bar on the right to display cartridge inventory and status information (Status > Cartridge Inventory > List View).
• **Drive Status** – The current drive activity for each drive in the module. The drive operation status is only displayed for the selected module. Click the drive icon to display the drive configuration and status information pop-up. The text below the icon is the current status:
  • **Write** – The drive is performing a write operation.
  • **Read** – The drive is performing a read operation.
  • **Idle** – A cartridge is in the drive but the drive is not performing an operation.
  • **Empty** – The drive is empty.
- **Encrypt** – The drive is writing encrypted data.

**RMI Center Pane Elements**

**NOTE:** When logged in as a general User, the only option available is the blue Status button. The other buttons are inactive and white to indicate Administrator usage only. The Service button is only shown when logged in as Service user.

Oversize buttons are shown that provide links to the following:

- **Open Mailslot** – Click to unlock the mailslot on the selected module. Refer to Open Mailslot on page 115 for details.

  **NOTE:** Mailslots must be enabled before they can be used. See Mailslots Configuration on page 94 on enabling Mailslots.

- **Open Magazine** – Click to unlock a magazine in the selected module. Only one magazine in the library can be open at a time. Refer to Open a Magazine on page 115 for details.

- **Configuration** – Click to configure the library. See RMI Configuration Options on page 80.

- **Maintenance** – Click to access maintenance functions. See RMI Maintenance Options on page 102.

- **Operation** – Click to access operation functions. See RMI Operation Options on page 113.

- **Status** – Click to access status information. See RMI Status Options on page 117.

**RMI Right Pane Elements**

Displays a log of recent events (Home page default) or additional options when a Center Pane option is selected. Options that have suboptions display a double down arrow (↓).

RMI Configuration Options

To configure the NEO with the RMI, at the main page click **Configuration**. The **Configuration** page has numerous options in the Right Pane from which to select.

See the following sections for details:

- **Initial Configuration Wizard**
- **System Configuration**
- **Network Configuration**
- **Network Management**
- **Drive Configuration**
- **Mailslots Configuration**
- **Partition Configuration**
- **Encryption Configuration**
- **User Accounts Configuration**
- **Web Management Configuration**

**Initial Configuration Wizard**

This is the same wizard you ran in the OCP when the library was first turned on. If, at a minimum, the network settings have been configured, you can rerun the wizard in RMI to set the administrator password, network configuration, timezone selection, date and time settings, and then update the configuration. Use the **Next**, **Back**, and **Finish** buttons to go through the wizard.
System Configuration

The Configuration > System option has the following suboptions:

- Save/Restore Library Configuration
- Date and Time Format
- Media Barcode Compatibility Check
- Allow Unlabeled Media
- License Key Handling
- RMI Timeout

Save/Restore Library Configuration

From the Configuration > System > Save/Restore Configuration screen you can save the library configuration settings to a file, restore the settings, or reset the library configuration to the default settings. The saved configuration database will make it easier to recover the library configuration if you need to replace the Base Module or Base Module controller.
To save a configuration file:

1. Navigate to Configuration > System > Save/Restore Configuration.
2. For saving the configuration file to a USB device on the library, insert a USB flash drive into one of the USB ports on the Base Module.
3. Select the destination location:
   - RMI – (RMI only) Downloads the configuration file to the browser or system running the RMI.
   - USB Device Front - Downloads the configuration file to a USB flash drive inserted into the USB port on the front of the library.
   - USB Device Rear - Downloads the configuration file to a USB flash drive inserted into the USB port in the back of the library.
4. Under Save Configuration File, click Save.
5. When the option buttons appear, click Download.
6. Select Save File and click OK to save the zip file.

To restore a previously saved configuration file:

NOTE: When restoring the configuration file from a USB device, copy the configuration file you want to restore onto the USB device and remove any other configuration files from the USB device.

1. Navigate to Configuration > System > Save/Restore Configuration.
2. Click the Restore Configuration File bar to open it.
3. For restoring the configuration file from a USB device on the library, insert a USB flash drive into one of the USB ports on the Base Module.
4. Select the destination location:
   - RMI – (RMI only) Restores the configuration file from the computer running the RMI. Click Browse to navigate to and select the configuration file.
   - USB Device Front - Restores the configuration file from a USB flash drive inserted into the USB port on the front of the library.
   - USB Device Rear - Restores the configuration file from a USB flash drive inserted into the USB port in the back of the library.
5. Click Choose File to navigate to and select the saved configuration file. The zip file normally starts with “sysconf-”.
6. Click Open.
7. Click the Upload File & Restore button that appears in the Restore section. This starts the uploading process and restores the configuration file from the system running the RMI. A messages show the upload and library restart. Once the library comes back online, you need to log back in.

To reset the library configuration to its default settings:

1. Navigate to Configuration > System > Save/Restore Configuration.
2. Click the Reset Default Settings bar to open it.
3. Click Reset.
   For information on the default settings, see Default Settings on page 197 in Appendix C, “Technical Specifications.”.
To reset the List of Known Drives and Modules:

1. Navigate to Configuration > System > Save/Restore Configuration.
2. Click the Reset the List of Known Drives and Modules bar to open it.
3. Click Reset.
   This feature does a re-discovery of installed hardware components. During this discovery, any modules and drives that are no longer in the library stack are removed from the list.

Date and Time Format

**NOTE:** The library does not adjust its time for daylight savings time. The time must be adjusted manually.

To configure date and time format parameters and use an SNTP server, navigate to Configuration > System > Date and Time Format.

To set the time zone for the library clock:

1. Click the Time Zone bar to open the option.
   A list of continents, countries, and regions is displayed.
2. Select a location from the list.
   When an item selected is proceeded with a greater than sign (>) symbol (for example, > America) is shown in a column, a submenu of locations is displayed in the next column.
3. If an expanded time zone list is shown in the next column, repeat Step 2 until a location with the appropriate time zone is visible (no “>”) and select that location.
4. Click Submit.
To set the date and time formats:

1. Click the **Date/Time Format** bar to open the option.

2. From the drop-down list, select a **Time Format**.

3. From the drop-down list, select a **Date Format**.
   
   For example, depending on the format selected, June 30, 2018 is displayed as:
   
   - **DD.MM.YYYY** – “30.06.2018”
   - **MM/DD/YYYY** – “06/30/2018”
   - **YYYY-MM-DD** – “2018-06-30”

4. Click **Submit**.

To set the library clock to the current date and time:

1. Click the **Set Date/Time** bar to open the option.

2. Enter the **time and date** in the given format.
   
   Alternately, to use current time and date of the local PC, click **Now**.

3. Click **Submit**.

To set the library clock using an SNTP server:

**NOTE:** The library must have network access to an SNTP (Simple Network Time Protocol) server to set the library clock using an SNTP server.

1. Click the **SNTP** bar to open the option.

2. Check the **SNTP Enabled** box.

3. Enter the **SNTP Server** address.

4. Click **Submit**.
Media Barcode Compatibility Check

To enable or disable the barcode media ID check, navigate to Configuration > System > Media Barcode Compatibility Check. The default is enabled. To disable, uncheck the option box and click Submit.

When the Barcode Media ID Restriction box is checked, the library only allows tape cartridges with the appropriate barcode media ID (the last two characters of the barcode) to be loaded into tape drives. For example, an LTO-8 labeled cartridge is not allowed to be moved into an LTO-7 tape drive.

When disabled, the library moves any tape into any tape drive. If the cartridge is incompatible with the tape drive, the library displays an error message.

**NOTE:** It is strongly recommended that ALL cartridges have barcode labels with the correct media ID, and that the Barcode Media ID Restriction is enabled.

Allow Unlabeled Media

To allow or disallow cartridges without labels from being used in the library, navigate to Configuration > System > Allow Unlabeled Media. The default is disallowed. To allow, check the option box and click Submit.

License Key Handling

To add or delete a license key, navigate to Configuration > System > License Key Handling.

To add a license key:

1. Enter a license key.
   The license key must be 15 characters in length.
2. Click Add License.
To delete all license keys:

**NOTE:** The button for deleting all license keys is only available on Service level.

1. Click **Delete License Key(s)**.

   **IMPORTANT:** Clicking the **Delete License Key(s)** button deletes all license keys currently in the library. All currently installed license keys are listed under the **License Key(s) in System** bar.

2. At the warning message, click **OK** to complete the action.

**RMI Timeout**

**NOTE:** The timeout is only selectable for RMI. The timeout for OCP is always set to 5 Minutes.

To set the timeout for RMI, navigate to the **Configuration > Web Management > Session Timeout** page.

1. From the drop-down menu, select a **timeout value** (5 or 30 minutes).
2. Click **Submit**.

**Network Configuration**

The **Configuration > Network** option is used to configure the following items:

- General Network Settings
- Primary Network Port
- Secondary Network Port
- Reset Internal IP Range
General Network Settings

The Host Name and Domain Name that was configured with the Initial Configuration wizard are used to access the RMI is in the form:

“<Host Name>.<Domain Name>”

To change these settings:

1. Navigate to the Configuration > Network page.
2. At the top, update the Host Name and Domain Name.
3. Click Submit.

Primary Network Port

Use these settings to change the primary port’s configuration.

1. With the Primary Network Port option opened, use the two drop-down menus to select the following:
   - Max. Link Speed – Select either 10 Mbit, 100 Mbit, or 1 Gbit (default).
2. Based on the Protocol setting selected, use the IPv4 and/or IPv6 sections to configure the protocol settings.
   To have the library obtain an IP address from a DHCP server instead of a Static IP address, select the DHCP (IPv4) or Stateless (IPv6) method.
3. Click Submit.

**Secondary Network Port**

If a secondary network port is used, open the **Secondary Network Port** option, check the **Port Enabled** box, and configure the same options as used for the Primary Network Port.

**Reset Internal IP Range**

**NOTE:** Only reset the internal IP range if you are using the same range in your network environment.

To reset the internal IP range, open the **Reset Internal IP Range (in case of conflict)** bar and click **Submit**.

For internal communication between modules the tape library uses an Ethernet connection with an internal IP address range. To prevent any conflict between the internal IP address range and the external IP addresses, it is necessary to select the internal IP range before the tape library gets connected to the external Ethernet port.

A file which contains the internal IP range is stored on the Base Module backplane (/opt/storage/mfg/stack/network.range and LCM /opt/storage/configuration/network.range).

The file is created through the OCP **IP Range** selection screen when the NEO starts for the very first time or if the library is reset to Manufacturing Defaults. The file can be reset via either OCP or RMI.

The Values must be in the following format:

```
RANGE=192.0.2
```

**NOTE:** The last section of the IP address is not set because it is set internally.

---

**Network Management**

The **Configuration > System** page has the following suboptions:

- **SNMP Configuration**
- **SMTP Configuration**
Remote Logging (rsyslog)

SNMP Configuration

Use the Configuration > Network Management > SNMP page to enable and configure SNMP (Simple Network Management Protocol), which allows applications to manage the device. The library supports both SNMP configuration and SNMP traps.

General SNMP settings:

- **SNMP Enabled** – When checked, SNMP and its configuration is enabled so that the library can be managed by computers listed in the SNMP Targets list.
- **Download MIB File** – Click to download an MIB file.
- **Community Name** – A string used to match the SNMP management station and library. It must be set to the same name on both the management station and the library. The default community name is **public**.
- **Notification Level** – Use the drop-down box to select the types of events for which the library should send email.
  - **Inactive** – No events are sent.
  - **Critical** – Only critical events are sent.
• + **Warnings** – Only critical and warning events are sent.
• + **Configuration** – Only critical, warning, and configuration events are sent.
• + **Information** – All events are sent.

With SNMP enabled, you can add, edit, or delete target information for an SNMP target.

To add or edit an SNMP target:
1. In the list, click **Edit** for the appropriate SNMP target.
   When adding a new SNMP target, click **Edit** next to a target without an **IP/Hostname**.
2. Enter or change the target **IP address or hostname**.
3. Enter or change the **port number**.
4. From the drop-down menu, select or change the **SNMP version**.
5. Enter or change the SNMP **community string** for the target.
   Normally, it is **public**.
6. If adding a new SNMPv3 target, also complete the **SNMPv3 fields** below the list.
7. Click **Submit**.

To delete an existing SNMP target:
1. In the list, click **Delete** next to the target to be deleted.
2. Click **Submit**.

To clear any SNMPv3 options previously entered:
   Click **Clear SNMPv3 Options** and confirm.

**SMTP Configuration**

From the **Configuration > Network Management > SMTP** page, you can enable SMTP (Simple Mail Transfer Protocol) functionality and configure email notification of library events. The library must have network access to an SMTP server.

![SMTP Configuration](image-url)
• **SMTP Enabled** – Check to enable SMTP and activate the configuration settings.

• **Notification Level** – Use the drop-down box to select the types of events for which the library should send email.
  - **Inactive** – No events are sent.
  - **Critical** – Only critical events are sent.
  - **+ Warnings** – Only critical and warning events are sent.
  - **+ Configuration** – Only critical, warning, and configuration events are sent.
  - **+ Information** – All events are sent.

• **SMTP Server** – Enter the Hostname or IP address of the SMTP server.

• **Security** – Use the drop-down box to select the Security protocol for accessing the SMTP server. Choose from *None*, *SSL/TLS*, or *STARTTLS*.

• **SMTP Port** – Use the drop-down box to select the SMTP server port. The default port for the selected protocol is selected. You can choose one of the default ports or configure a custom port.

• **To Email Address** – Enter the email address to receive the reported events (for example, firstname.lastname@example.com). Only one email address can be configured.

• **Mailer Name** – Enter the name of the sender of the notification email.

• **Email Subject** – Enter the subject line for the email message.

• **Emailer Address** – Enter the return address to use for the email message.

• **Authentication Required** – When checked, a user name and password are required to access the SMTP server. The appropriate fields are activated.

• **Username** – User account for logging into the SMTP server when authentication is required.

• **Password** – The password associated with the Username when authentication is required.

Click **Submit** to make the changes and send a test email.

**Remote Logging (rsyslog)**

Use the **Configuration > Network Management > Remote Logging (rsyslog)** page to enable remote logging into the library.

- **Remote Logging Enabled** – Check to enable remote logging and activate the configuration settings.

- **Notification Level** – Use the drop-down box to select the types of events for which the library should send email.
  - **Inactive** – No events are sent.
• **Critical** – Only critical events are sent.
• **+ Warnings** – Only critical and warning events are sent.
• **+ Configuration** – Only critical, warning, and configuration events are sent.
• **+ Information** – All events are sent.

- **Remote Logging Server** – Enter the Hostname or IP address of the Remote Logging server.
- **Remote Logging Port** – Use the drop-down box to select the Remote Logging server port. You can choose the default port or configure a custom port.
- **Transport Protocol** – Use the drop-down box to select the transport protocol for accessing the Remote Logging server. Choose from **UDP** or **TCP**.

## Drive Configuration

Use the **Configuration > Drives > Settings** page to view and modify drive settings.

Drive information is shown in the option bar:

- **Drive number** – Drives are numbered from the bottom of the library up beginning with one. The drive currently hosting the SCSI communication for the library is designated with (LUN).
- **Serial Number (S/N)** – The serial number assigned to the tape drive by the library. This serial number is reported to host applications. The serial number cannot be modified. This is not the serial number assigned to the drive by the manufacturer. That serial number is shown in **Manufacturer S/N**.
- **LTO generation** – The supported version of the LTO drive:
  - **LTO-5** – LTO-5 Ultrium Tape Drive
  - **LTO-6** – LTO-6 Ultrium Tape Drive
  - **LTO-7** – LTO-7 Ultrium Tape Drive
  - **LTO-8** – LTO-8 Ultrium Tape Drive
• **Drive form factor:**
  • HH – Half height
  • FH – Full height

• **Drive interface:**
  • FC – Fibre Channel
  • SAS – Serial Attached SCSI

• *(Modified)* – When this text is present, it indicates that one or more settings have been changed. To apply the changes, click **Submit**. To reset all changed fields to their previously saved values, click **Undo**.

• **Power Status (Pwr)** – Indicates whether the drive is currently powered ON or OFF.

**Additional information is shown below the option bar:**

• **Firmware** – The version of firmware currently installed on the drive.

• **Manufacturer S/N** – The serial number assigned to the drive when it was manufactured. Use this serial number when working with Technical Support.

**Configurable options:**

• **Power On** – Box is checked when the drive is ON. Uncheck the box to power off the drive.

  **NOTE:** Always power off a tape drive before removing it from the library or moving it to a new location within the library.

• **Port x Configuration** (FC only) – Port configuration settings for each port on an FC drive.
  • **Speed** – Use the drop-down box to select a speed. The default is **Automatic**. Choices are 2 GB/s, 4 GB/s, or 8 GB/s.
  • **Port Type** – Use the drop-down box to select a type. The default is **Automatic**. Choices are **Loop** and **Fabric**.
  • **Addressing Mode** – When **Port Type** is set to **Loop**, you can choose an **Addressing Mode**. Choices are **Soft** and **Hard**.
  • **Loop ID / ALPA** – When **Addressing Mode** is set to **Hard**, you can choose an ALPA address from the drop-down list.

To apply the changes, click **Submit**. To reset all changed fields to their previously saved values, click **Undo**.

**NOTE:** To configure the number of barcode characters to report to the host application and whether to report them from the left or right end of the label, use either the **Basic Partition Wizard** or **Expert Partition Wizard**.
Mailslots Configuration

The Configuration > Mailslots page lists each of the mailslots and shows the status.

![Configuration > Mailslots](image)

To change a mailslot state, click the status button on the far right for the appropriate mailslot and then click Submit. Slots not enabled as mailslots are available as storage slots.

The determine the automatic mailslot relock time, using the drop-down menu, select either 30 seconds (default) or 5 minutes, and then click Submit.

Partition Configuration

Use the wizards on the Configuration > Partitions page to configure or change partitions in the library.

![Configuration > Partitions](image)

The Configuration > Partitions page has the following suboptions:

- **Partitions**: Basic Partition Wizard
- **Expert Wizard**: Use this wizard to create or modify customized partitions, as well as to configure advanced partition options.

The library has a flexible partitioning scheme with a few key constraints:

- Each partition must have at least one tape drive.
- One drive in each partition hosts the library LUN for the partition.
- The maximum number of partitions is 20.
- Magazine slots are allocated in five-slot groups.
• Mailslots must be enabled for a module before they can be allocated to a partition. A partition does not need to have a mailslot. If a partition does not have a mailslot, the full magazine must be accessed to import or export cartridges. Opening a magazine takes the library offline. Although mailslot magazines can be shared between partitions, the mailslots are assigned individually to partitions.

The partition wizards guide you through the partition configuration process. The wizards are only accessible from the RMI.

• Basic Partition Wizard
• Expert Partition Wizard

You can only use the Expert Partition Wizard to adjust the allocation of resources after first creating the partitions with the Basic Partition Wizard.

CAUTION: The library goes offline while partitions are being configured. Ensure that all host operations are idle before running either partition wizard.

Basic Partition Wizard

Use the Basic Partition Wizard to configure partitions that will have similar resources. The wizard removes the current partition configuration and assigns the drives and storage slots as evenly as possible to the partitions. Any extra drives or slots are assigned to the first partition.

NOTE: For a library with a single partition, use it to configure the number of barcode characters to report to the host application and whether to report them from the left or right end of the label.

1. Navigate to Configuration > Partitions > Basic Wizard to start the wizard. If partitions already exist, the Information page displays them. They will be deleted by the wizard. You can Cancel to keep existing partitions.

2. To proceed, click Proceed and then click Next.

3. The Create Partition Scheme page displays the number of slots, mailslots, tape drives, and maximum available partitions for the library.
**NOTE:** If you want to enable or disable the mailslots, Cancel out of the wizard and update the mailslot configuration before configuring partitioning.

4. Select the **number of partitions**.

5. Select the **number of barcode characters** reported to the host application.
   
   This option provides interchange compatibility with libraries with more limited barcode reading capabilities. The maximum length is fifteen and the default is eight. This configuration is apply to all partitions.

   **NOTE:** The industry standard length for LTO barcode labels is eight characters. Barcode labels longer than eight characters might scan incorrectly, particularly if they are not high quality labels.

6. Select whether to report the barcode characters from the **left** or **right** end of the barcode label to the host application when reporting fewer than the maximum number of characters.
   
   For example, when reporting only six characters of the barcode label **12345678**, if alignment is left, the device reports back **123456**. If alignment is right, the device reports back **345678**. The default is left.

7. Click **Next**.
   
   The **Finish Configuration** page displays the proposed allocation of library resources into partitions.

8. Do one of following:
   
   - To make other changes to the configuration, click **Back**.
   - To have the wizard configure partition as shown, click **Finish**.

   After the wizard reconfigures the partition, the library comes back online automatically.

9. To exit the wizard, click **Exit**.
Expert Partition Wizard

Use the Expert Partition Wizard to configure partitions that will have different resources or to adjust resource assignments for existing partitions or those created with the Basic Partition Wizard. This wizard can add or remove partitions from the current partitions configuration and then edit each partition configuration to add or remove library resources.

Click Configuration > Expert Wizard to start the wizard. The Create Partition Scheme page lists the current partitions (if any) and the free resources. Use the wizard to configure one partition at a time.

**NOTE:** If you want to enable or disable the mailslots, Cancel out of the wizard and update the mailslot configuration before configuring partitioning.

**To add a partition:**

**NOTE:** The add option and Add button is only active if there are available resources. If there are no available resources, either edit a partition to release resources from it or remove a partition that contains extra resources.

1. Click Add and then click Next.
2. Enter a name for the partition.
3. Select the number of barcode characters reported to the host application.
   This option provides interchange compatibility with libraries with more limited barcode reading capabilities. The maximum length is fifteen and the default is eight. This configuration applies to all partitions.

   **NOTE:** The industry standard length for LTO barcode labels is eight characters. Barcode labels longer than eight characters might scan incorrectly, particularly if they are not high quality labels.
4. Select whether to report the barcode characters from the left or right end of the barcode label to the host application when reporting fewer than the maximum number of characters.

For example, when reporting only six characters of the barcode label 12345678, if alignment is left, the device reports back 123456. If alignment is right, the device reports back 345678. The default is left.

5. Click Next.

6. In the Assign Storage Slots page, use the >> and << buttons to assign slots to the new partition and then click Next.

7. In the Assign Mail Slots page, use the >> and << buttons to assign mailslots to the new partition and then click Next.

   Individual mailslot elements cannot be shared between partitions. Importing or exporting cartridges in a partition without an assigned mailslot requires magazine access, which takes the library offline.

8. In the Assign Drives page, use the >> and << buttons to assign drives to the new partition and then click Next.

9. If the partition has multiple tape drives, select the drive that hosts the SCSI communication for the partition and then click Next.

   The lowest numbered drive in the partition is the default.

10. Verify the partition configuration and then click Finish.

   After the wizard reconfigures the partition, the library comes back online automatically.

To remove a partition:

1. Select the partition, click Remove, and then click Next.

2. Verify that you want to remove the partition, and then click Finish.

   After the wizard removes the partition, the library comes online automatically.

Encryption Configuration

This option is only accessible by a Security user.
When logged in as a Security user, use this option to control the encryption of partitions or entire library.

Under Set Default Encryption Mode for New Partition, use the drop-down menu to select if new partitions are encrypted by the backup application or if licensed KMIP encryption is used. Click Apply to All Existing Partitions if you want encryption on previously created partitions.

Under General Settings, check the box to allow an Administrator to enable or disable encryption on a per-partition basis bypassing Security.

Under Set Encryption Mode per Partition, use the drop-down menus to select the encryption for each existing partition.

If KMIP encryption is licensed, you can run the KMIP Wizard to configure it.

User Accounts Configuration

The Configuration > User Accounts page has the following suboptions:

- User Accounts
- LDAP

The supported user types are:

- User – This account allows access to only the library status information and does not allow access to configuration, maintenance, or operation features. A password is not required for the user account. Setting a user password restricts access to even the status information. The library initially has no User password.

- Administrator – Setting an administrator password provides restricted access to the administrator functions of the RMI. The library initially has a default administrator password adm001.
User Accounts

Use the Configuration > User Accounts > Local User Accounts option to set the passwords for up to 80 user or administrator accounts.

To create a new user account, click the Add User + button. From the drop-down menu, select the user type and then enter and confirm the new password in the blank fields. The password must contain 8-16 characters, which can include upper- and lower-case letters, numbers, and special characters.

Highlight a user in the list and use the Actions drop-down menu to modify a password, change role permissions for magazines and mailslots, change an OCP PIN, or remove an existing user other than the basic User and Administrator.

LDAP

Use the Configuration > User Accounts > LDAP option to configure LDAP servers and users.

To create a new LDAP account, click either the Add Server + or Add User + button. The appropriate pop-up window appears.
Fill in the fields as appropriate and click **OK**. To test the configuration for the server, click **Test Connection**.

On the option page, highlight a server or user in the lists and use the **Actions** drop-down menu to modify or remove the server/user.

For very long lists, you can enter a partial name in the search field and click **Filter By Name**. Wildcards are not supported.

**Web Management Configuration**

Enable or disable secure access to the RMI using Secure Socket Layer (SSL) or Secure Shell (SSH) from the **Configuration > Web Management** screen. When SSL is enabled, connections to the RMI must use HTTPS. The default is disabled.

When SSH is enabled, the library will only accept SSH connections. The default is enabled.
RMI Maintenance Options

To maintain the NEO Tape Library with the RMI, at the main page click **Maintenance**. The **Maintenance** page has numerous options in the Right Pane from which to select.

From the **Home** page, click **Maintenance** to access the library maintenance features:

- Library Tests
- Logs and Traces
- Software Upgrades
- Download Drive Logs
- System Reboot
- Drive Reboot
- UID LED Control
- Move Robotic to Base Module
- Support Information

**Library Tests**

The **Maintenance > Library Tests** page has the following options:

- System Test
- Slot-to-Slot Test
- Element-to-Element Test
- Position Test
- Wellness Test
- Robotic Test
- OCP Test (with LCD Adjustment Reset)

**System Test**

The **System Test** exercises overall library functionality by moving cartridges within the library.

During each cycle the library moves a cartridge from a full slot to an empty drive and then returns it to its original slot. You can select the number of cycles for the test. If the test is canceled, the library returns the cartridge to its original slot.

- The library does not move cleaning cartridges during the test.
- The test operates over the whole library and does not take into account partition configuration.
- During the test the library is offline.

**To run the test:**

1. Navigate to the **Maintenance > Library Tests > System Test** page.
2. Select the **number of cycles**.
3. Select if it is a **Seating** or **Threading** test.
4. Click the **Start Test** button that appears.

**Slot-to-Slot Test**

The **Slot-to-Slot Test** randomly exchanges cartridges between slots to verify that the library is operating correctly.

At the end of the test the cartridges are NOT returned to their original slots.

If a tape is moved to an incompatible drive, the drive will reject the tape, as designed.
• The test operates over the whole library and does not take into account partition configuration.
• During the test the library is offline.

**NOTE:** For service and diagnostics, use the Robotic Test (see Robotic Test on page 107).

To run the test:
1. Navigate to the Maintenance > Library Tests > Slot-to-Slot Test page.
2. Select the number of cycles.
3. Click the Start Test button that appears.

**Element-to-Element Test**

The Element-To-Element Test moves a selected cartridge to a selected slot or tape drive, and then returns it to the original slot. You can select the number of times to move the selected cartridge to the destination location and back. It is intended to show that the library is operating correctly.

- One element must contain a cartridge and the other must be empty.
- You can select the number of times to move the selected cartridge to the destination location and back.
- If a tape is moved to an incompatibly drive, the drive will reject the tape, as designed.
- During the test the library is offline.

**NOTE:** To diagnose problems with the Robotic Assembly or verify that it has been correctly replaced, use the Robotic Test (see Robotic Test on page 107).

To run the test:
1. Navigate to the Maintenance > Library Tests > Element-to-Element Test page.
2. Select a cartridge from the Source Elements list.
   To select from a subset of the cartridges:
   a. Click Filter On.
   b. Enter barcode label characters into the search box.
   c. Click Search.
   The Source Elements list is updated to only include cartridges with a barcode label including the search characters.
3. Select an empty location from the Destination Elements list.

4. Select the number of cycles.

5. Click the Start Test button that appears.

**Position Test**

The Position Test moves the Robotic Assembly vertically between two element locations. The test does not move cartridges. The test is intended to show that the vertical movement of the Robotic Assembly is operating correctly.

- You can select the number of times to move the Robotic Assembly between two element positions.
- During the test the library is offline.

**NOTE:** To diagnose problems with the Robotic Assembly itself or verify that it has been correctly replaced, use the Robotic Test (see Robotic Test on page 107).

**To run the test:**

1. Navigate to the Maintenance > Library Tests > Position Test page.
2. Select a source location from the Source Elements list.
3. Select a destination location from the Destination Elements list.
4. Select the number of cycles.
5. Click the Start Test button that appears.
Wellness Test

The **Wellness Test** exercises a general health check on library functionality by running the following partial tests:

- Basic Hardware Review
- Robotics Initialization
- Barcode Scanning Test
- Magazine/Mailslot Unlock Motor Test
- Move Media Test

Running the test requires **each module** to have:

- At least one enabled and functional drive.
- One cartridge with a barcode label.

After the test has been started, the **Stop Test** button is active. Clicking the button aborts the Wellness Test but not before the current partial test has been completed.

- The test operates over the whole library and does not take into account partition configuration.
- During the test the library is offline.

The **Info** column notifies the user about the status and result of each partial test.

**To run the test:**

**NOTE:** For quickest test execution, it is recommended to have one functional drive in each module and eight compatible cartridges in the corner slots of the same module.

1. Navigate to the **Maintenance > Library Tests > Wellness Test** page.
2. Click **Start Test**.
Robotic Test
The Robotic Test exercises all Robotic Assembly movements and sensors. During the test the library is offline.

To run the test:
1. Navigate to the Maintenance > Library Tests > Robotic Test page.
2. Click Start Test.

OCP Test (with LCD Adjustment Reset)
The Maintenance > Library Tests > OCP Test exercises functionality of the front panel LEDs or resets the contrast and brightness of the OCP LCD display.

To start a test/reset, select it from the drop-down menu, and click Start.
- LED Test – Switches every LED on/off sequentially left to right and right to left. During the test, the library is offline.
- Reset LCD Adjustment – Resets the OCP LCD contrast and brightness back to the defaults (50% and 100%).

Logs and Traces
Logs are created for every event, information alert, and configuration change.
The Maintenance > View Logs and Traces page has the following options:

- View Logs
- Download Logs and Traces
View Logs

To view the library log files, navigate to the Maintenance > Logs and Traces > View Logs page and then select one of the logs. Use the drop-down menu on the right to choose a type of log. Click a row in the table list to view a specific log.

Available log types are:

- **Event Ticket Log** – Records library error and warning events. The log entries contain a ticket number, date and time code, event code, description, current event state, component type, component identifier, and severity.

- **Information Log** – Records library information warnings. The log entries contain a date and time code, event code, and description.

- **Configuration Log** – Records configuration changes. The log entries contain a date and time code, event code, and description.

The log entries are displayed in order of most recent to oldest. The format for the date and time code is:

**DD.MM.YYYY HH.MM.SS**

(Day.Month.Full_Year.Hour.Minute.Second)

Download Logs and Traces

**NOTE:** Users and Administrators should download support tickets instead of log and trace files because the support ticket will have complete information about each library event and is easier to read. See Download Drive Logs on page 110 on how to generate a support ticket.

To download the library log and trace files from the RMI:

1. Navigate to the Maintenance > Logs and Traces > Download Logs and Traces page.
2. Click Save.
Software Upgrades

Library and drive firmware can be upgraded to the latest version. Customization of the library is also available from this page.

The Maintenance > Software Upgrades page has the following options:

- System Firmware Upgrade
- Drive Firmware Upgrade
- Customization

System Firmware Upgrade

The firmware version currently installed on the library is displayed in the library status area on the upper left corner of the Home page. You can update the library firmware from the Maintenance > Software Upgrades > System Firmware page.

To update library firmware with the RMI:

1. Click Choose File and select the firmware file (.FBI) from the local computer.
2. Click Start Upgrade that appears.

NOTE: When you update the library firmware, the library also updates the firmware of any expansion modules to a compatible version.
Drive Firmware Upgrade

Drive firmware can be updated on multiple drives of the same type at the same time. Each drive only accepts the appropriate firmware for that type of drive.

To see the firmware version currently installed on the drives, navigate to the Maintenance > Software Upgrades > Drive Firmware page.

To update drive firmware with the RMI:

1. Navigate to the Maintenance > Software Upgrades > Drive Firmware page. The tape drives are organized by drive type.
2. Expand the appropriate drive type option and select one or more of the tape drives. Click the box in the table title bar to select all drives of that type.
3. Click Choose File, and then select the file from the local computer.
4. Click Submit.

Customization

**IMPORTANT:** This option is for Factory use only.

Download Drive Logs

**NOTE:** Only one drive at a time can be selected for downloading its log.
From the Maintenance > Download Drive Logs page you can download a support ticket from the library or any of the tape drives.

To download a drive log:

1. If necessary, expand the Drive Logs list by clicking the option bar. The list displays:
   - **Drive** – The drive number. Drives are numbered starting with the one at the physical bottom of the library up to the top.
   - **Type** – The drive manufacturer, LTO version, form factor (half height or full height), and interface (FC or SAS).
   - **Firmware** – The current drive firmware version number.
   - **Serial** – The drive serial number.
   - **Module** – The module containing the tape drive.
   - **Partition** – The logical library associated with the tape drive.

2. Select a **drive** by checking the box next to it. Clicking a different drive clears the previous selection.

3. Once a drive is selected, use the drop-down menu above the table title bar to select the type of **log** (DMP file) to download:
   - **Regular Dump** – This option downloads a regular dump file for the tape drive.
   - **Forced Dump** – This option downloads a forced dump file for the tape drive.
4. Click **Save**.
   The process may take up to 10 minutes. When a regular or forced dump is done, the
   creation message displays **Download** and **Cancel** buttons.

![Creating Drive Log](image)

5. For a Regular or Forced Dump, click **Download** and select whether to open or save it.

**System Reboot**

To reboot the library with the RMI, navigate to the **Maintenance > System Reboot** page and
then click **Reboot**.

**Drive Reboot**

**NOTE:** Only one drive at a time can be selected for rebooting.

To reboot a drive with the RMI:
1. Navigate to the **Maintenance > Drive Reboot** page.
2. From the list, select the **drive** you want to reboot.
3. Click **Submit**.
4. At the confirmation message, click **Yes** to start the reboot.

**UID LED Control**

The UID LEDs are a pair of blue LEDs—one on the front OCP and the other on the Base
Module controller in the rear. The UID LEDs are useful for identifying the library in a data
center. The UID LEDs are operated synchronously and controlled by the user. From the
**Maintenance > UID LED Control** page, you can see whether the LEDs are lit and toggle the
status.

![Maintenance > UID LED Control](image)

To select and switch on the UID LEDs:
1. Navigate to the **Maintenance > UID LED Control** page.
2. Click **Switch LEDs On**.
3. When done, click **Switch LEDs Off**.

**Move Robotic to Base Module**

Before extending a module from the rack, the Robotic Assembly must return to its park position in the Base Module. Under normal circumstances, when the library is powered off using the front power button, the robot automatically parks and locks in the Base Module behind the OCP.

⚠️ **CAUTION:** After powering off the library and before proceeding with extending a module from the rack, look inside the Base Module window to verify that the Robotic Assembly is behind the OCP.

If the library did not move the Robotic Assembly to its park position, you can do so from the **Maintenance > Move Robotic to Base Module** page.

To move the robotic assembly back to the Base Module:

1. Navigate to the **Maintenance > Move Robotic to Base Module** page.
2. Click **Submit**.

**Support Information**

The **Maintenance > Support Information** page shows how to obtain technical support for your NEO Tape Library either online or via telephone.

**RMI Operation Options**

For daily operation the NEO Tape Library with the RMI, at the main page click **Operation**. The **Operation** page has several standard options in the Right Pane from which to select.

Click **Operation** on the **Home** page to access the RMI library operations features.

- **Move Media**
• Open Mailslot
• Open a Magazine
• Clean a Tape Drive
• Rescan Cartridge Inventory
• Force a Drive to Eject a Cartridge

Move Media

From the Operation > Move Media page you can move a tape cartridge located in a source element to an available destination element within the same partition.

Element list organization is as follows:

• Mailslots are listed first in the order of the mailslot numbers. Mailslots are numbered $m.s$, where $m$ is the module number and $s$ is the mailslot within the module.
• Tape drives are listed next and in the order of their drive numbers. Tape drives are numbered from the physical top of the library starting with Drive (1).
• Slots are listed in the order of the slot numbers. Slots are numbered $m.s$, where $m$ is the module number and $s$ is the slot within the module.

To see a subset of the cartridges in the library:

1. With the Barcode Filter On (default), enter some or all of the barcode label characters in the search field.
2. Click Search.
   The Source Elements list updates to display only the cartridges with labels that include the characters in the search box.
3. To perform a different search or display all of the available cartridges, toggle the filter to Barcode Filter Off.

To move a cartridge:

1. Select the cartridge from Source Elements.
   The element name appears as the Move Source at the bottom of the table.
2. Select the destination location from Destination Elements.
   The element name appears as the To Destination at the bottom of the table.
3. Click Submit.
   A move message is displayed. When done, the source list updates to show the new location of the cartridge and the destination list updates to show the previous location as empty and available.

Open Mailslot

From the Operation > Open Mailslot page you can see the status of and unlock any enabled mailslot in the library.

To open a mailslot, click Open for the appropriate mailslot. The library releases the lock and you can then pull the mailslot out of the library to access it.

**NOTE:** The mailslot relocks after 30 seconds (or 5 minutes if so configured) if it is not opened.

For information about manually opening a mailslot, see Magazine Manual Release on page 41. The mailslot must be enabled before it can be opened. To enable a mailslot, see Mailslots Configuration on page 94.

Open a Magazine

From the Operation > Open Magazine page you can unlock any magazine in the library.

To unlock a magazine, click Open for the appropriate magazine. The library releases the lock. You can then pull the magazine out of the library to access the storage slots.
NOTE: Opening a magazine takes the library offline. The magazines relock after 30 seconds (or 5 minutes if so configured) if not opened.

For information about manually opening a magazine, see Magazine Manual Release on page 41.

Clean a Tape Drive

From the Operation > Clean Drive page you can initiate a drive cleaning operation.

1. Select a cleaning cartridge from the Source Elements list. The library uses the barcode label (CLNxxxxx) to identify cleaning cartridges. If no cleaning cartridges are available, load one using a mailslot or magazine slot.

2. Select the tape drive to be cleaned from the Destination Elements list. Tape drives currently containing a cartridge are not listed. To clean a tape drive not listed, move the cartridge out of the drive.

3. Click Submit.

Rescan Cartridge Inventory

To have the library rescan the cartridges, navigate to the Operation > Rescan Inventory page and click Rescan. The library changes to Scanning (Offline) status and is unavailable to perform other operations until the scan is complete.
Force a Drive to Eject a Cartridge

The Force Drive Media Eject operation attempts to force the tape drive to eject the cartridge and place it into an open slot. Access to this feature requires the administrator password.

Before performing this option, it is recommended that you attempt to eject the tape using the backup software or library Move Media operation. While a drive is being force ejected, a window indicating the process is ongoing should appear. No operations are available until the force eject completes.

**NOTE:** If the drive has difficulty ejecting the cartridge, the media is possibly bad or damaged.

1. Navigate to the Operation > Force Drive Media Eject page.
2. Select the drive in the Source Elements list.
3. Select the destination in the Destination Elements list.
4. Click Submit.

RMI Status Options

To view the status the NEO Tape Library and its components with the RMI, at the main page click Status. The Status page has several options in the Right Pane from which to select.

Click Status on the Home page to access the RMI library statuses.

- Library (and Module) Status
- Cartridge Inventory
- Partition Map
- Drive Status
- Network Status
- Security Status

Library (and Module) Status

A summary of library information and status is displayed in the Top Banner and the Left Pane. For additional library module configuration and status information navigate to the Status > Library Status page.
There are three areas on this page:

- **Library Information**
- **Library Status**
- **Module Status**

### Library Information

If necessary, click the option bar to view the following items listed in this section.

- **Vendor**
- **Serial Number** – Library serial number.
- **Robotic Hardware Revision**
- **Barcode Reader Hardware Revision**
- **WWide Node Name** – World Wide Node Number.
- **Product ID**
- **Firmware Revision** – Version of the currently installed library firmware.
- **Robotic Firmware Revision** – Version of the currently installed Robotic Assembly firmware. The Robotic Assembly firmware is bundled and installed with the library firmware.
- **Barcode Reader Firmware Revision** – Version of the currently installed barcode reader firmware. The barcode reader firmware is bundled and installed with the library firmware.

### Library Status

If necessary, click the option bar to view the following items listed in this section.

- **Library Status** (matches the status in the Top Banner).
  - **Idle** – The library robotic is ready to perform an action.
  - **Moving** – The library robotic is moving a cartridge.
• **Scanning** – The library robotic is performing an inventory of cartridges.
• **Offline** – The library robotic has been taken offline by the library.
• **Cartridge in Transport** – When applicable, displays the barcode label of the cartridge currently in the Robotic Assembly.
• **Robotic Location** – Displays the module where the robotic is currently located.
• **Total Power On Time** – Total time that the Base Module has been powered on since it was manufactured.
• **Odometer** – Robotic assembly move count.
• **Shipping Lock** – Indicates whether the robotic is unlocked or locked for shipment.

**Module Status**

If necessary, click the option bar to view the following items listed in this section.

• **Base/Expansion Controller Revision** – Hardware revision of the controller board currently installed in the module selected.
• **Lower Power Supply Fan** – Displays the status of the power supply fan in the lower PSU bay.
• **Left Drive Power Board** – Status of the Drive Power Board (DC-DC converter) for the drive slots in the module.
• **Chassis Fan** – Shows the status of the cooling fan for the chassis.
• **Power Supply Status** – Displays the status of power redundancy.
• **Upper Power Supply Fan** – Displays the status of the power supply fan in the upper PSU bay.
• **Right Drive Power Board** – Status of the Drive Power Board (DC-DC converter) for the drive slots in the module.

You can click **Refresh** to update the statuses.

**Cartridge Inventory**

To see the library slots, cartridges and drives organized by module, navigate to **Status > Cartridge Inventory**. From there, select either **Graphical View** or **List View** of elements. Both inventory view options display each of the elements with information about any cartridge stored in the slot or drive.

**NOTE:** Cartridges stored in unused slots, which are not available for move operations, are grayed out and are not assigned to any partition.

There are the different types of cartridge views:

• **Cartridge Graphical View**
• **Cartridge List View**

**Cartridge Graphical View**

The graphical view is broken out by module, displaying each of the elements (such as slots and tape drives) with information about the cartridge stored in that element.
NOTE: Unused slots, which are not available for move operations, are grayed out and marked with a cross. Any cartridges stored in these slots are displayed in the same way as regular slots.

Moving the mouse over a drive image displays additional information:

- The top area shows the drive number, drive type, and drive details (LTO generation / form factor).
- The middle area shows the drive serial number, partition number, and SCSI element address.
- The bottom area shows:
  - If a cartridge is in the drive, the barcode, LTO generation, partition it originated from, the number of times it has been loaded, if the data is encrypted, and the type of cartridge (data or cleaning) is shown.
  - If no cartridge is in the drive, it just shows “empty.”

Moving the mouse over a slot or cartridge image displays additional information:
• If a cartridge is in the slot, when clicked, a pop-up shows the barcode, LTO generation, the slot number (in the form \(m.s\) where \(m\) is the module number and \(s\) is the slot number), partition in which it is located, SCSI element address, the number of times it has been loaded, if the data is encrypted, and the type of cartridge (data or cleaning).

• If empty, nothing is displayed.

Warning and error states for a specific drive or cartridge are indicated with colored icons.

Cartridge List View

To see a list of the elements organized by module, navigate to Status > Cartridge Inventory > List View. The default view is one of all the slot elements.

The List View displays:

• **Module** – The module number.

• **Slot # / Drive #**
  - For slots, it shows the slot number (in the form \(m.s\) where \(m\) is the module number and \(s\) is the slot number) showing where the cartridge currently is located.
  - For drives, it shows the drive number (numbered from the bottom upward) showing where the cartridge currently is located.

• **Barcode** – The barcode label (if any).

• **Full** – \(X\) if a cartridge is in the slot.

• **Gen.** – LTO generation of the cartridge.

• **Slot** (drives only) – The slot from which the cartridge originated.

• **Partition** – The partition number.

**NOTE:** Cartridges stored in unused slots, which are not available for move operations, are grayed out and are not assigned to any partition.
The default view is cartridges in slots. The buttons at the top can filter the display by toggling the view:

**Slots or Drives.** To limit the list to just tape drives, click **Drives.** Only the drive elements are show and the button changes to **Slots.** To return to the default slots view, click **Slots.**

**Cartridges or Elements.** To limit the list to just library elements with cartridges in them, click **Cartridges.** To return to a full list of the elements, empty or full, click **Elements.**

**Grouping.** When **Group On** is clicked, the list is grouped by module. You can expand or contract the list for each group by clicking the triangle next to the module number in the first column. To disable grouping, click **Group Off.**

**Filtering by Barcode Label.** To filter the list based on the barcode label, click **Filter On** to display a Search field, enter barcode characters in the Search field, and click **Search.** The characters can be anywhere in the label. The search characters are not case sensitive. There are no wildcards. To disable filtering and show all the slots, click **Filter Off.**

**Partition Map**

To see the elements organized by partition, navigate to **Status > Partition Map.** There are three different types of partition views:

- **Partition Map View**
- **Partition Graphical View**
- **Partition Configuration Status**

Both inventory view options display each of the elements with information about any cartridge stored in the slot or drive.

**NOTE:** Cartridges stored in unused slots, which are not available for move operations, are grayed out and are not assigned to any partition.

The **Configuration Status** displays the partition information.
Partition Map View

To see a list of the elements organized by partition, navigate to **Status > Partition Inventory > List View**. The default view is one of all the slot elements.

The layout and features are the same as for **Cartridge List View on page 121**. The Groups are by partition instead of module.

Partition Graphical View

The graphical view is broken out by partition, displaying each of the elements (such as slots and tape drives) with information about the cartridge stored in that element.

**NOTE:** Unused slots, which are not available for move operations, are grayed out and marked with a cross. Any cartridges stored in these slots are displayed in the same way as regular slots.

The graphical view of the partition map displays the partition number for every magazine. In the example below, Magazine #8, which can be configured as mailslot magazine, displays single slots. When they are configured as mailslots, the slot number gets a leading ‘M’.
Moving the mouse over a part of a partition displays additional information:

- **Name** – Partition name.
- **Barcode** – The barcode length and orientation reported to the host.
- **Media Removal** – Indicates whether media removal is allowed or prevented by the host.
- **Key Manager Type** – Encryption management type.
- **Partition S/N** – Serial number of the partition.
- **Drive Count** – Number of drives in this partition.
- **Slot Count** – Number of slots in this partition.
- **Cartridge Count** – Number of cartridges in this partition.
- **Mailslot Count** – Number of mailslots in this partition.
**Partition Configuration Status**

To see the configuration of a partition, its elements, and their status, navigate to **Status > Partition Map > Configuration Status**.

If necessary, click the partition option bar to open it. The **Configuration Status** shows:

- **Partition Number** – The partition number.
- **Partition Name** – The partition name.
- **Partition S/N** – The partition serial number.
- **Partition WWide Node** – The partition WWide node number.
- **Number of Drives** – Number of drives in this partition.
- **Number of Slots** – Number of slots in this partition.
- **Number of Mailslots** – Number of mailslots in this partition.
- **Barcode Label Length Rep. to Host** – Barcode length reported to the host.
- **Barcode Label Alignment Rep. to Host** – Barcode alignment reported to the host.
- **Auto Clean** – Indicates whether automatic cleaning of drives is enabled or disabled.
- **Key Manager Type** – Encryption management type.
- **Active Control Path Drive** – LUN drive for this partition.
- **LTO7 Multi-initiator SCSI Conflict Detection** – Indicates whether Multi-initiator Conflict Detection is enabled or disabled.

Click **Refresh** to update the status. Click **Expand All** to expand all partition data sections. Once expanded, click **Collapse All** to collapse all partition data sections to just option bars.
Drive Status

In the Status> Drive Status page you can see the configuration and status of each drive installed in the library.

Drive information is shown in the option bar:

- **Drive number** – Drives are numbered from the bottom of the library upwards.
- **Serial number** – The serial number (S/N) assigned to the tape drive by the library that is reported to host applications. The serial number cannot be modified.
- **Vendor/LTO Generation/Form Factor/Interface** – Basic drive information. See Drive Configuration.
- **Library Health** – An icon indicating the overall health status of the library.
- **Drive Status** – The current drive activity.
- **Power Status** – Indicates whether the drive is currently powered ON or OFF.

If necessary, click the drive option bar to open it. The Drive Status page shows:

- **Vendor**
- **Firmware** – The version of firmware currently installed on the drive.
- **Powered** – Indicates whether the drive is currently powered ON or OFF.
- **Temperature**
- **Encryption** – Type of encryption management.
- **IP Address**
- **Module Loc** – Partition containing the drive.
- **Cooling Fan Status** – Drive cooling fan status.
- **SCSI Element Addr**
- **Personality**
After the horizontal bar, the port information is shown:

For FC drives:

- **Speed** – Shows 2 Gb/s, 4 Gb/s, or 8 Gb/s.
- **Port Type** – Either Loop (type) or Fabric.
- **Interface** – Shows the status of the interface such as Login complete or No light detected.
- **Loop ID / ALPA** or Port ID

For SAS drives:

- **Speed** – Shows 1.5 Gb/s, 3 Gb/s, or 6 Gb/s.
- **Interface** – Shows either Connected or Not Connected.

Click **Refresh** to update the status. Click **Expand All** to expand all partition data sections. Once expanded, click **Collapse All** to collapse all drive data sections to just option bars.

### Network Status

<table>
<thead>
<tr>
<th>Status &gt; Network Status</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Host Name:</strong> TL1C38DE</td>
</tr>
<tr>
<td><strong>Domain Name:</strong> devnet.myoverland.net</td>
</tr>
<tr>
<td><strong>Primary Network Port</strong></td>
</tr>
<tr>
<td><strong>MAC Address:</strong> 00:0c:11:1f:33:df</td>
</tr>
<tr>
<td><strong>Link Status:</strong> Enabled</td>
</tr>
<tr>
<td><strong>Link Speed:</strong> 1000 Mbit/s</td>
</tr>
<tr>
<td><strong>Duplex:</strong> Enabled</td>
</tr>
<tr>
<td><strong>Protocol:</strong> IPv4</td>
</tr>
<tr>
<td><strong>Secondary Network Port</strong></td>
</tr>
<tr>
<td><strong>MAC Address:</strong> 00:0c:11:1f:33:df</td>
</tr>
<tr>
<td><strong>Link Status:</strong> Disabled</td>
</tr>
<tr>
<td><strong>Link Speed:</strong> N/A</td>
</tr>
<tr>
<td><strong>Duplex:</strong> Disabled</td>
</tr>
<tr>
<td><strong>Protocol:</strong> IPv4</td>
</tr>
</tbody>
</table>

If necessary, click the drive option bar to open it. The **Network Status** page shows:

- **Host Name** – Library hostname.
- **Domain Name**
• Protocol – IPV4 or IPV6.

• General Network Settings:
  • MAC Address – A unique identifier for the library controller network interface in the format \textit{xx:xx:xx:xx:xx:xx}.
  • Link Status – Enabled or Disabled.
  • Link Speed – The speed (Mbit/s) of the Ethernet connection to the library.
  • Duplex – Enabled or Disabled.

• IPv4 settings (if used):
  • DHCP – When DHCP is enabled, the library requests an IP address from a DHCP server each time the library is powered on.
  • Address – IP address in use by the library. If DHCP is enabled, this address was obtained from the DHCP server. When DHCP is not enabled, the address was configured (static).
  • Netmask – The network mask of the library controller used when DHCP is not enabled.
  • Gateway – The gateway used when DHCP is not enabled.
  • DNS 1 – IP address of the primary DNS server.
  • DNS 2 – IP address of the secondary DNS server.

• IPv6 settings (if used):
  • Stateless Addressing – When enabled, the device generates an address for itself based on the routing information obtained from a router advertisement and the MAC address. The device can manage up to five global addresses at the same time, which can be assigned from different routers.
  • Static Addressing – When enabled, the library uses a statically-configured address.
  • Static Assigned Address – The IPv6 address when Static Addressing Enabled is On.

Security Status

In the Status> Security Status page you can see the security encryption type status and that of each partition and installed drive in the library.

There are three areas on this page:
• Security Encryption Status
• Partition Encryption Status
• Drive Encryption Status

Security Encryption Status
• KMIP – Enabled and licensing statuses.

Partition Encryption Status
Click each partition option bar to view the following:
• Partition Number
• Partition Name and S/N (Serial Number)
• Encryption Configuration

Drive Encryption Status
The table has three columns for each drive’s encryption status:
• Drive – A list of installed drives.
• Encryption – The status of encryption on each drive.
• Partition No. – The partition with which the drive is associated.
Service and Upgrades

Only qualified personnel who are informed about the procedures and risks should service or upgrade the NEO hardware. Read all troubleshooting documentation and procedures (refer to the Preface) before proceeding with repair or upgrade procedures.

**WARNING:** To reduce the risk of electric shock or damage to equipment, always remove any power cords while working with the library.

**WARNUNG:** Um das Risiko eines elektrischen Schlags oder Schäden am Gerät zu vermeiden, ziehen Sie stets den Netzstecker, bevor Sie an der Einheit arbeiten.

**AVERTISSEMENT:** Pour réduire le risque de choc électrique ou endommagement de l'équipement, retirez toujours les cordons électriques en travaillant avec l'appareil.

**CAUTION:** While working with the library, observe standard Electrostatic Discharge (ESD) precautions to prevent damage to micro-circuitry or static-sensitive devices.

If needed, contact Technical Support for more information.

Here is a list of possible tools you can need:

- #2 Phillips Screwdriver
- Small Flat-head or Torx Screwdriver
- T10 Torx Screwdriver
- Small Flat-head Screwdriver
- Clip Nut Installation Tool

**Topics in Service and Upgrades:**

- Identify a Failed Component
- Install or Replace a Tape Drive
- Replace a Power Supply
- Replace a Controller Board
- Install or Replace a Drive Power Board
- Adding an Expansion Module
- Replace a Module (Base or Expansion)
- Move a Tape Library
- Replace the Robotic Assembly and Spooling Mechanism
- Replace the Base Module Front Bezel/OCP
**Identify a Failed Component**

Use the RMI to identify a failed component:

1. From the Maintenance > UID LED Control RMI page, activate the UID (Unit Identification) LEDs.
   This illuminates the blue LED on the front and rear of the Base Module to identify the library containing the failed component.
2. Identify the module within the library that contains the failed component:
   a. In the upper left corner of the Home page, locate the module that indicates an error.
   b. Click the module for information on the failed component.

**Install or Replace a Tape Drive**

IMPORTANT: Review “Electrostatic Discharge” in the “Preface” before replacing a library component.

**Remove a Tape Drive**

Before replacing a tape drive:

- Make sure the tape cartridge has been removed from the tape drive. Use the OCP or the RMI to move the cartridge to a storage slot or mailslot.
- If you are replacing the tape drive in a single drive unit or the master drive in a multi-drive unit, verify that backups are not occurring on the drive you are replacing. If backups are occurring on the master drive, verify that the autoloader or library will not be accessed through this drive while the drive is being replaced.

To remove a tape drive:

1. Use the OCP or RMI to power off the tape drive.
2. Verify that the tape drive assembly LED is off, and then remove the FC or SAS cable from the tape drive.
3. Loosen the **blue captive thumbscrews** on the tape drive.

4. Pull straight back using the tape **drive handle** (while supporting the bottom) to remove it from the unit.

Continue with Install a Tape Drive on page 133.

**Remove a Drive Bay Cover**

If installing an additional tape drive in a module, you need to remove one half-height drive bay cover to install a half-height (HH) drive or two HH covers to install a full-height (FH) drive.

1. Identify the **location** for the tape drive.
   
   If this is the first tape drive, install it in the bottom drive bay. Otherwise, install the new drive in the next higher drive location.

2. Use a #2 Phillips screwdriver to remove the **two screws** securing the plate.
   
   Save the plate and screws for possible future use.
Install a Tape Drive

To install a tape drive:

1. While supporting the drive assembly on the bottom, align and slowly insert the **new tape drive** into the open drive bay. The tape drive should be flush with the back panel of the device when inserted.

2. Tighten the **blue captive thumbscrews** with your fingers until the tape drive is secure.

Connect the Drive Cables

Connect a SAS Cable

1. Attach the **HBA end** of the SAS cable into the connector on the HBA. If you are using a SAS fanout cable, the end with only one connector should be plugged into the HBA.

2. Connect the **drive end** of the cable.
   - If you are using a cable with a single connector on each end, attach the other end into the connector on the tape drive.
   - If you are using a SAS fanout cable, attach one mini-SAS connector into the connector on each tape drive. The unused ends of the SAS fanout cable are single channel and not suitable for use with disk arrays. Either use the other ends to connect tape drives, or coil and secure them to the rack to minimize stress on the connectors.

**NOTE:** Each of the tape drives uses one channel and the fanout cable recommended for use with the library maps each of the four channels from the HBA to one channel on the drive end. You can plug any of the four drive connectors into any tape drive.
Tip: If you are not using a SAS cable specified for the library, do not force a SAS cable's mini-SAS connector into the tape drive mini-SAS connector because it might be keyed differently.

NOTE: SAS signal rates require clean connections between the HBA and tape drive. Do not use adapters or converters between the HBA and the tape drive. For reliable operation, use a maximum SAS cable length of six meters.

Connect A Fibre Channel Cable

1. If necessary, remove the FC port caps.
2. Attach one end of the FC cable to Port A on the tape drive.
3. Attach the other end of the FC cable to a switch or HBA.

When installing a new tape drive, it is recommended that you leave the FC interface settings at the default settings of Port Speed: Automatic and Port Type: Auto Detect. With these settings, the tape drive uses the appropriate configuration.

Verify the Installation

1. If necessary, power on the drive from the OCP or RMI.
2. Confirm that the library recognizes the new tape drive.
   The new drive should appear in the module status overview area on the left side of the OCP screen or RMI page.
3. Verify that the tape drive has the current firmware.
   Update the firmware if necessary. You can update firmware from the RMI (Maintenance > Software Upgrades > System Firmware) or the OCP (Maintenance > Software Upgrades).

Replace a Power Supply

IMPORTANT: Review “Electrostatic Discharge” in the “Preface” before replacing a library component.

Identify the Failed Component

Use the RMI page (Maintenance > UID LED Control) to activate the UID (Unit Identification) LEDs to locate the library in the data center. For detailed instructions, see Identify a Failed Component on page 131.
**Prepare to Remove the Power Supply**

Locate the failed power supply on the rear of the library by either the bottom green LED (3) being unlit or all LEDs being unlit.

Unplug the AC power cord from the power supply you are replacing.

**Remove the Power Supplies**

1. Loosen the two blue captive thumbscrews with your fingers on the power supply.
2. Use the thumbscrews (one on each side) to slowly pull the power supply out about 4 inches (10cm).
3. While supporting the bottom, remove the power supply from the module.

**Install the New Power Supply**

1. Position the new power supply onto the alignment rails.
2. Slide the power supply into the module until it is flush with the back panel of the module.
3. Tighten the blue captive thumbscrews with your fingers to secure it to the module.
4. Attach the AC power cord to the new power supply.

**Verify the Power Supply Installation and Operation**

1. Verify that the new power supply is operating properly by checking that all power supply LEDs are lit.
2. Using the RMI, confirm that the event that indicated the power supply was faulty should be cleared.
3. If the UID LEDs are still illuminated, deactivate them using the RMI.
Replace a Controller Board

**CAUTION:** You must power off the library to install or replace this part to prevent damage from occurring.

**IMPORTANT:** Review “Electrostatic Discharge” in the “Preface” before replacing a library component.

**NOTE:** Do not replace both the Base Module chassis and the Base Module controller in the same procedure. The firmware does not allow the library to operate if both components are replaced at the same time. The library WWID and serial number are saved in the controller and within the chassis. When one is replaced, the data from the original component is transferred to the repair component. If replacing both the Base Module chassis and Base Module controller, you must power cycle the library between component replacements.

### Identify the Failed Component

Use the RMI page (Maintenance > UID LED Control) to activate the UID (Unit Identification) LEDs to locate the library in the data center. For detailed instructions, see Identify a Failed Component on page 131.

### Save the Configuration

The library configuration settings are on the library chassis and are restored automatically when the controller is replaced. However, it is recommended to save the configuration settings before removing the controller board as a precaution. See Save/Restore Library Configuration on page 81 for instructions on saving configuration settings to a file or USB flash drive.

### Power Off the Library

1. From the front panel, press and hold the **power button** for three (3) seconds.

   **NOTE:** If the library does not perform a soft shutdown, press and hold the power button for ten (10) seconds.

2. Verify that the **Robotic Assembly** is in its parked position.

3. Verify that all **host processes** are idle.

### Prepare to Remove the Controller

1. Unplug the **AC power cables** from the module containing the failed controller.
2. If present, remove the expansion interconnect cables that connect to other modules.

3. If present, remove the Ethernet cables and the USB device.

   Expansion Module controllers do not have Ethernet or USB ports.

Remove the Controller

1. Loosen the two blue captive thumbscrews on the controller.

2. Using the thumbscrews, slowly remove the controller from the module.

Install the Controller

1. Position the new controller on the alignment rails.

2. Slowly slide the controller into the module until it is flush with the back panel of the module.

3. Tighten the blue captive thumbscrews with your fingers to secure it to the module.

4. If previously removed, replace the expansion interconnect cables.

5. If previously removed, replace the Ethernet cables and USB device.

6. Plug in the AC power cables.

Verify the Controller Installation

1. Using the OCP or RMI, click Status > Library Status > Module x to view the controller status.

2. Check that the event indicating the controller was faulty is now cleared.

3. Verify that the library has the most up-to-date firmware revision.

   To find the version of firmware installed on the library, check the upper left corner of the OCP or RMI.

4. If necessary, update the firmware using the RMI Maintenance > Firmware Upgrades > System Firmware page.

5. If replacing the Base Module controller, restore the previous settings by restoring them from a file of saved settings, or by entering them using the OCP or RMI.
6. If the UID LEDs are still illuminated, deactivate them using the RMI.
7. Resume the host applications.

**Power On the Library**

Power on the library by pressing the power button just below the OCP display. The green light illuminates.

When the library is powered on, it inventories the tape cartridges in the magazines, checks the firmware version on all modules, configures the tape drives, confirms the presence of the existing modules, and searches for any new modules.

**Install or Replace a Drive Power Board**

> **IMPORTANT:** Review “Electrostatic Discharge” in the “Preface” before replacing a library component.

**Identify the Failed Component**

Use the RMI page (Maintenance > UID LED Control) to activate the UID (Unit Identification) LEDs to locate the library in the data center. For detailed instructions, see Identify a Failed Component on page 131.

**Power Off the Library**

1. From the front panel, press and hold the power button for three (3) seconds.

![Power Button](image)

> **NOTE:** If the library does not perform a soft shutdown, press and hold the power button for ten (10) seconds.

2. Verify that the Robotic Assembly is in its parked position.
3. Verify that all host processes are idle.

**Remove the Library Chassis Fan and Drive Power Board**

The Drive Power Boards are located behind the Chassis Fan.

1. Unplug the AC power cords from the module containing the failed Drive Power Board.
2. Loosen the two blue captive thumbscrews on the Chassis Fan.
3. Using the thumbscrews, slowly remove the **Chassis Fan** from the module and set it on a secure ESD surface.

4. Push the defective Drive Power Board **latch** down to release it.

5. Slowly slide the **Drive Power Board** out of the module.

**Install the New Drive Power Board**

1. Position the **new Drive Power Board** onto the alignment rails.
2. Slide the Drive Power Board into the **module** until seated firmly.
3. Push the board **latch** up until it snaps firmly into place. When the Drive Power Board is installed correctly, the latch will not be loose.
4. Position the **Chassis Fan** on the alignment rails and slide it in until it is flush with the back panel of the module.
5. Tighten the **thumbscrews** with your fingers to secure it to the module.
6. Plug in the **AC power cords** disconnected previously.

**Power On the Library**

Power on the library by pressing the power button just below the OCP display. The green light illuminates.
When the library is powered on, it inventories the tape cartridges in the magazines, checks the firmware version on all modules, configures the tape drives, confirms the presence of the existing modules, and searches for any new modules.

**Verify the Drive Power Board Installation**

1. Verify that all tape drives that are present are powered on.
2. Check that the event indicating the Driver Power Board was faulty is now cleared.
3. From the back of the library, verify that the green LED on each drive is illuminated.
4. If the UID LEDs are still illuminated, deactivate them using the RMI.
5. Resume the host applications.

**Adding an Expansion Module**

**IMPORTANT:** Review “Electrostatic Discharge” in the “Preface” before replacing a library component.

**Overview**

To install an additional Expansion Module to a NEO XL-Series Tape Library:

1. If necessary, clear space in the rack.
2. Install the rack rails.
3. If necessary, transfer the top or bottom cover to the Expansion Module.
4. Install the Expansion Module in the rack and align the module with the library.
5. Plug in the cables and verify the installation.

You need a small flat-head or Torx screwdriver and a #2 Phillips screwdriver.

**Power Off the Library**

1. From the front panel, press and hold the power button for three (3) seconds.

**NOTE:** If the library does not perform a soft shutdown, press and hold the power button for ten (10) seconds.

2. Verify that the Robotic Assembly is in its parked position.
3. Verify that all host processes are idle.
Move a Cover to the New Module

The library has removable top and bottom covers. When adding a module to the top or bottom of the stack, you must move either the top or the bottom cover to the new module. Refer to Library Module Preparation on page 28 for details.

While this procedure refers to moving a cover from the Base Module, the information is the same for moving a cover from an Expansion Module.

Install the Module in the Rack

See Install Modules in Rack on page 29 for details and instructions.

Align and Connect the Module

Aligning the new module with the library ensures that the robot can move freely between the modules. The library will not operate unless the alignment mechanism is in the locked position. See Aligning and Connecting Modules on page 31 for details.

Verify the Installation and Configuration

Power on the library and check the following:

- Verify that the library powers on and initializes correctly, and that the status is Ready.
- From the OCP or RMI, verify that the new Expansion Module is visible.
- Check the library configuration settings related to the additional storage slots, mailslots, and tape drives. Update if necessary.

The Expansion Module operates using the existing library firmware. It is recommended that you always update the library to the latest firmware version. You can update firmware from the RMI (Maintenance > Software Upgrades > System Firmware) or the OCP (Maintenance > Software Upgrades).

Replace a Module (Base or Expansion)

IMPORTANT: Review Chapter 2, “Installation,” before replacing a module or moving the library. Review the documentation that comes with the replacement module for the latest information about this process.

To replace a module in a NEO XL-Series Tape Library:

1. Save the library configuration.
2. Remove tape cartridges and power off the library.
3. Remove the tape drives and disconnect the power cords and cables.
4. Remove the module from the rack and unpack the new module.
5. Swap covers and components from the old to the new module.
6. Install the replacement module into the rack and align it.
7. Reinstall the tape drives and reconnect the power cords and cables.
8. Reinsert the tape cartridges.
9. Power on the library and verify the operation.
You need a T-10 Torx screwdriver to remove the drive bay covers and a small flat-head screwdriver.

**Save the Configuration**

The library configuration settings are on the library chassis and is restored automatically when the controller is replaced. However, it is recommended to save the configuration settings before removing the controller board as a precaution. See *Save/Restore Library Configuration on page 81* for instructions on saving configuration settings to a file or USB flash drive via the OCP or RMI.

**Prepare Module for Removal**

Each NEOxl 80 Base Module weighs more than 78.3 lbs. (35.5kg) without drives or tapes and more than 104.3 lbs. (47.5kg) with six tape drives and 80 tapes. Before moving or lifting the module, remove the tape magazines and drives to reduce the weight.

**Remove the Tape Cartridges**

**IMPORTANT:** As a best practice, perform this procedure while applications are idle. While the magazine is pulled or removed, the library Robotic Assembly cannot move media. Only one magazine can be open at a time.

1. Using either the magazine **unlock buttons** or RMI, unlock a tape magazine.

   **NOTE:** If these methods fail, or if a magazine needs to be removed when the power to the device is off, you can release the magazine manually. Refer to *Magazine Manual Release on page 41*.

2. Supporting it underneath, remove the **tape magazine**.

   **NOTE:** Do not remove the tape cartridges from the magazine as they need to be in the same slot locations in the new module.

3. Repeat these process for the **other** magazine.
Power Off the Library

1. From the front panel, press and hold the **power button** for three (3) seconds.

   ![Power Button]

   **NOTE:** If the library does not perform a soft shutdown, press and hold the power button for ten (10) seconds.

2. Verify that the **Robotic Assembly** is in its parked position.
3. Verify that all **host processes** are idle.

Remove the Cables

Where applicable for the module being replaced:

1. Remove all the **power cords** (1).
2. Unplug the **expansion module interconnect cables** (2) from the unit and the modules to which they are connected.
   
   **NOTE:** Completely removing the cables from both ends prevents damaging the expansion interconnect cables during module removal and replacement.

3. When replacing a Base Module, if necessary, remove any **Ethernet cables** (3) from the module.
4. Remove and label **SAS/FC cables** (4) from the drives.
5. When replacing a Base Module, if necessary, remove the optional **USB device** (5).
**Remove the Tape Drives**

Where applicable for the module being replaced:

**NOTE:** Because library tracks the drive locations and issues events if the drives aren't in the expected locations, make a note of the drive locations and label the drives so they can be replaced in the same drive bays.

1. Use your fingers to loosen the **blue captive thumbscrews** on the tape drive.
2. While supporting the bottom of the drive, pull straight back on the tape **drive handle** to remove it from the module.

---

**CAUTION:** Support the bottom of the tape drive when removing it to avoid damaging any of the internal connections.

---

3. Place the drive on a secure **ESD surface**.
4. Repeat this process for any **additional drives**.

**Remove Module from Rack**

---

**WARNING:** To avoid injury, we recommend the use of a mechanical lifting aid (or at least two persons) for rack installation or removal. Use caution during rack installation or removal to avoid accidentally tilting or tipping the rack or injuring yourself.

**WARNUNG:** Um Verletzungen zu vermeiden, empfehlen wir zur Rack-Installation oder -Deinstallation die Nutzung einer mechanischen Hebehilfe (oder mindestens zwei Personen). Seien Sie vorsichtig bei der Rack-Installation oder -Entnahme, um ein versehentliches Kippen des Racks zu vermeiden und das Rack nicht zu beschädigen bzw. sich selbst zu verletzen.

**AVERTISSEMENT:** Afin d’éviter des blessures pendant l’installation, il est recommandé d’utiliser un monte-charge (ou au moins deux personnes) pour éléver ou aligner l’module. Faites attention lorsque vous insérez ou retirez l’module d’un support, pour empêcher le déversement accidentel de la crémaillère causant des dommages et des blessures.
1. From the front, use a #2 Phillips screwdriver to loosen the recessed screws two full turns on both the module and any adjacent modules.

2. From the back of the library, unlock the alignment mechanisms connecting the module with any adjacent modules.

3. Carefully slide the module out onto a mechanical lifter.

4. Place the module on a secure ESD surface.

5. Unpack the new module and place it on the surface next to the old module.

### Move Covers and Components

#### Move Covers

**IMPORTANT:** When replacing a module that has a top and/or bottom cover, you must move the covers from the old module to the new one.

1. Remove the cover plate.
a. Place the **module** on a work table.
   If you are removing the bottom cover, gently turn the module over so you can access the bottom of the module.

b. Insert a small flathead screwdriver or Torx **tool** down into the hole to release the spring lock (1).

c. Slide the cover forward (2) until it reaches the tool in the hole, remove the tool, and continue sliding the cover to the front until all the tabs are released.

d. Remove the **cover** (3) from the module.

e. If the module is upside down, gently return it to its normal position.

2. Install the cover on the other module.

a. Place the other module on the work table.
   If the module will be the bottom module in the library, gently turn the module over so you can access the bottom of the module.

b. Align all cover tabs with the slots on the module, gently push the cover down, and then slide it towards the back of the module until the spring lock (1) engages.

c. If the module is upside down, gently return it to its normal position.
Move the Power Supplies

**NOTE:** If any power supplies are installed, they need to be moved to the new module.

1. At the **new** module, remove the appropriate power supply **covers**.
2. At the **old** module, loosen the **two blue captive thumbscrews** with your fingers on the power supply.
3. Use the thumbscrews to pull the **power supply** out about 4 inches (10cm).
4. While supporting the bottom, remove the **power supply**.
5. At the **new** module, position the power supply onto the **alignment rails**.
6. Slide the power supply into the **module** until it is flush with the back panel of the module.
7. Tighten the **thumbscrews** with your fingers to secure it.
8. If necessary, repeat these steps for a **redundant power supply**.
9. Install the removed power supply covers on the **old** module.

Move Controller

1. At the **old** module, loosen the **two blue captive thumbscrews** on the controller and slowly remove it from the module, setting it aside.

2. If a **Drive Power Board** is installed, also move it:
   a. Push down the Drive Power Board **latch** to release it.
   b. Slowly slide the **Drive Power Board** out of the module.
   c. At the **new** module, position the Drive Power Board onto the **alignment rails**.  
   d. Slide the **Drive Power Board** in until seated firmly.
   e. Push the board **latch** up until it snaps into place.
3. At the **new** module, position the **controller** on the alignment rails and slide it in until it is flush with the back panel of the module.
4. Tighten the **thumbscrews** with your fingers to secure it to the module.

Move Drive Bay Covers

If any drive bays on the old Expansion Module have covers installed, they need to be moved to the new Expansion Module.
**Insert the Module in Rack**

**WARNING:** To avoid injury, we recommend the use of a mechanical lifting aid (or at least two persons) for rack installation or removal.

**WARNUNG:** Um Verletzungen zu vermeiden, empfehlen wir zur Rack-Installation oder -Deinstallation die Nutzung einer mechanischen Hebehilfe (oder mindestens zwei Personen).

**AVERTISSEMENT:** Afin d’éviter des blessures pendant l’installation, il est recommandé d’utiliser un monte-charge (ou au moins deux personnes) pour élever ou aligner l’module.

1. Using the mechanical lifter, position the **module** in front, aligned with the rack rails.
2. Slide the module onto the **rail flanges** and into the rack.
3. Tighten the **recessed screws** only one turn to hold the module.
4. At the back of the library, using the alignment lock lever, align and lock the new module to any adjacent modules.

**NOTE:** The library will not operate unless the alignment mechanism is in the locked position (except the bottom module).

Release the thumbscrew (1), push down the latch (2), and re-tighten the thumbscrew (3).

If you encounter resistance, adjust the upper module so that the alignment mechanism pin moves into the mating hole in the lower module.

5. Verify that, for the lowest module in the library, its alignment mechanism is in the **unlocked position**.

6. From the front of the library, tighten the Phillips screws on both the new module and any adjacent modules to secure them all to the rack.

**Complete the Installation**

**Reinstall Tape Drives**

If any tape drives were in the old module, install them in the same bays in the new module:

1. Holding a **tape drive** by the handle and supporting it from the bottom, position it on the alignment rails of the appropriate bay.
2. Slowly slide the tape drive into the **drive bay** until it is flush with the back of the library.

3. Finger-tighten the **blue captive thumbscrews** to secure.

4. Repeat Steps 1–3 for any additional tape drives.

### Reattach Cables and Cords

1. Reconnect the **expansion interconnect cables** (2) from the Expansion Module to any adjacent Expansion Modules.

2. If previously removed from the old Base Module, reconnect any **Ethernet management cables** (3).

3. Reconnect any **SAS/FC cables** (4) to the same tape drives.

4. If previously removed from the old Base Module, reinsert the **USB device** (5).

5. Reconnect the **AC power cords** (1) to the power supplies.

### Reinstall Tape Magazines

Reinstall the previously removed tape magazines into the new module.
1. Using the magazine **access handle** and supporting it underneath, position the magazine on the alignment rails.
2. Slide the **magazine** into the module.
3. Repeat **Steps 1–2 for the other magazine**.

**Verify the Library Configuration**

Power on the library and check the following:

- Verify that the library powers on and initializes correctly, and that the status is **Ready**.
- From the OCP or RMI, verify that the new module is visible.
- Check the library configuration settings related to the additional storage slots, mailslots, and tape drives. Update if necessary.

The module operates using the existing library firmware. It is recommended that you always update the library to the latest firmware version. You can update firmware from the RMI (**Maintenance > Software Upgrades > System Firmware**) or the OCP (**Maintenance > Software Upgrades**).

**Move a Tape Library**

**IMPORTANT:** Review Chapter 2, “Installation,” before moving the library. When moving a library either within a rack or to a different rack, care must be taken to avoid personal injury and damage to the module.

To move a tape library:

1. Save the library configuration.
2. Remove any tape cartridges from the tape drives, remove the tape magazines, and power off the library.
3. Disconnect the power cords and cables, and unlock the alignment mechanisms.

**CAUTION:** Failure to disconnect all cables can result to damage to the cable and/or the mating electronic assembly in the library.

4. Carefully release and remove the modules from the rack.
5. Remove the rack rails from the rack and, after verifying that the destination rack is level side to side and front to back, install the rails in the destination rack.
6. Carefully install the modules in the rack and lock the alignment mechanisms.
7. Reconnect the cables to the appropriate ports.
8. Connect the power cords, power on the library, and verify the operation.
9. Reinstall the tape magazines.

See Replace a Module (Base or Expansion) on page 141 for details.
Replace the Robotic Assembly and Spooling Mechanism

Use this process to replace the Robotic Assembly and Spooling Mechanism in a Base Module.

**IMPORTANT:** Review “Electrostatic Discharge” in the “Preface” before replacing a library component.

Prepare Module for Removal

Each Base Module weighs more than 78.3 lbs. (35.5kg) without drives or tapes and more than 104.3 lbs. (47.5kg) with six tape drives and 80 tapes. Before moving or lifting the module, remove the tape magazines and drives to reduce the weight.

Remove the Tape Cartridges

**IMPORTANT:** As a best practice, perform this procedure while applications are idle. While the magazine is pulled or removed, the library Robotic Assembly cannot move media. Only one magazine can be open at a time.

1. Using either the magazine **unlock buttons** or RMI to unlock a tape magazine.

   **NOTE:** If these methods fail, or if a magazine needs to be removed when the power to the device is off, you can release the magazine manually. Refer to Magazine Manual Release on page 41.

2. Supporting it underneath, remove the **tape magazine**.

   **NOTE:** Do not remove the tape cartridges from the magazine as they need to be in the same slot locations in the new module.

3. Repeat these process for the **other** magazine.
**Power Off the Library**

1. From the front panel, press and hold the **power button** for three (3) seconds.

   ![Power Button](image)

   **NOTE:** If the library does not perform a soft shutdown, press and hold the power button for ten (10) seconds.

2. Verify that the **Robotic Assembly** is in its parked position.

3. Verify that all **host processes** are idle.

**Remove the Cables**

1. Remove all the **power cords** (1).

2. Unplug the **expansion module interconnect cables** (2) from the Base Module and any adjacent modules.

   **NOTE:** Completely removing the cables from both ends prevents damaging the expansion interconnect cables during module removal and replacement.

3. Remove any **Ethernet cables** (3) from the module.

4. Remove and label the **SAS/FC cables** (4) from the drives.

5. If present, remove the optional **USB device** (5).

**Remove the Tape Drives**

Remove the tape drives to lessen the module’s weight.
NOTE: Because library tracks the drive locations and issues events if the drives aren't in the expected locations, label the drives so they can be replaced in the same drive bays.

1. Use your fingers to loosen the blue captive thumbscrews on the tape drive.
2. While supporting the bottom of the drive, pull straight back on the tape drive handle to remove it from the module.

![Diagram]

**CAUTION:** Support the bottom of the tape drive when removing it to avoid damaging any internal connections.

3. Place the drive on a secure ESD surface.
4. Repeat this process for any additional drives.

**Remove Module from Rack**

**WARNING:** To avoid injury, we recommend the use of a mechanical lifting aid (or at least two persons) for rack installation or removal. Use caution during rack installation or removal to avoid accidentally tilting or tipping the rack or injuring yourself.

**WARNUNG:** Um Verletzungen zu vermeiden, empfehlen wir zur Rack-Installation oder -Deinstallation die Nutzung einer mechanischen Hebehilfe (oder mindestens zwei Personen). Seien Sie vorsichtig bei der Rack-Installation oder -Entnahme, um ein versehentliches Kippen des Racks zu vermeiden und das Rack nicht zu beschädigen bzw. sich selbst zu verletzen.

**AVERTISSEMENT:** Afin d’éviter des blessures pendant l’installation, il est recommande d’utiliser un monte-charge (ou au moins deux personnes) pour élever ou aligner l’module. Faites attention lorsque vous insérez ou retirez l’module d’un support, pour empêcher le déversement accidentel de la crémaillère causant des dommages et des blessures.
1. From the front, use a #2 Phillips screwdriver to loosen the recessed screws two full turns on both the Base Module and any adjacent modules.

2. From the back of the library, unlock the alignment mechanisms connecting the Base Module with any adjacent modules.

3. Carefully slide the Base Module out onto a mechanical lifter.

4. Place the module on a secure ESD surface.

5. Unpack the new Robotic Assembly and Spooling Mechanism, placing them next to the module.

Remove Top Cover

If the Base Module has a top cover, it must be removed:

1. Place the Base Module on a work table. If you are removing the bottom cover, gently turn the Base Module over so you can access the bottom of the module.

2. Insert a small flathead screwdriver or Torx tool down into the hole to release the spring lock (1).
3. Slide the cover forward (2) until it reaches the tool in the hole, remove the tool, and continue sliding the cover to the front until all the tabs are released.

4. Remove the cover (3) from the module.

5. If the Base Module is upside down, gently return it to its normal position.

**Remove Old Robotic Assembly**

Remove the old Robotic Assembly and the Spooling Mechanism for replacement.

**Unlock the Robotic Assembly**

*NOTE:* If necessary, slide the robotics’ cartridge carrier manually toward the center of the Robotic Assembly to access the blue locking lever.

Standing at the front of the module, unlock the robot by moving the blue lever to the left, then toward you, then to the right.

If a tape cartridge is still in the Robotic Assembly cartridge carrier, remove the cartridge by lifting it straight up. You may need to move the cartridge slightly from side to side.
Extract the Robotic Assembly from the Module

Gently pull the Robotic Assembly out of the module.

1. Place your fingers into the **large holes** on the Robotic Assembly and pull up slowly (about 1/2 inch [13mm] per second) until clear.

2. Lift the **Robotic Assembly** gently from inside the module and place it on top of the module on the right side (opposite the Spooling Mechanism) and slightly to the front.

   **NOTE:** Be careful not to damage the spooling cable.

Remove the Spooling Mechanism

1. Detach the **spooling cable connector** from the Robotic Assembly.

   a. Use a small flat-head screwdriver or Torx tool to press the **small latch** down (1) and push it out (2) to unlock the **spooling cable connector** on the robotics rear left.

   b. Pivot the **connector** out from the Robotic Assembly, loop the cable over the top of the Spooling Mechanism, and slip the end of the connector into the docking slot (3) at the top of the mechanism.

   The spooling cable should lay flat across the top of the mechanism.

   **NOTE:** Note the hooks on the Robotic Assembly where the end of the spooling cable pivots. This is important to know when you attach the new spooling cable to the new Robotic Assembly.

2. Move the Robotic Assembly to a secure **ESD surface**.
3. Remove the Spooling Mechanism.
   a. Press down the latch (1) at the top rear of the Spooling Mechanism.
   b. Move the entire Spooling Mechanism gently upward until the rear connector releases.
   c. Pull the Spooling Mechanism to the front, releasing it from the rear metal wall, and set it aside.

Install the New Robotic Assembly

Install the new Spooling Mechanism and Robotic Assembly in the Base Module.

Install the New Spooling Mechanism

1. Hold the new Spooling Mechanism in front of the rear metal wall attachment point with the docked spooling connector to the top left.

2. Align the latch at the top rear of the Spooling Mechanism with the keyhole in the rear metal wall.

3. Push the Spooling Mechanism in and then to left until the rear plug is connected and the mechanism snaps into place.
   It may help to push the right side with your other hand.

Install the Robotic Assembly

1. Position the new Robotic Assembly resting on the right side of the module.
2. Verify that the Robotic Assembly is **unlocked**.
   If not, unlock it by moving the blue lever to the left, then toward the front, and then to the right.

3. Attach the Spooling Mechanism **connector**:

   ![Spooling Mechanism Connector](image)

   a. Unlock the **connector** from the Spooling Mechanism top and hold it with the latch end up.
   b. Place the **cable end** into the Robotic Assembly hooks.
   c. Pivot the **top** into position so that latch connects.

4. Rotate **one of the corner gears** on the Robotic Assembly so that the two pins are **aligned horizontally**.
   All the gears are synchronized and will also be aligned.

5. Gently place the Robotic Assembly gears onto the top of the **grooves** of the four vertical gear rails.

   ![Robotic Assembly Gears](image)

6. Gently push the Robotic Assembly down until the **base** of the Robotic Assembly is on the bottom of the module.

   **CAUTION:** Lower the Robotic Assembly no faster than 1/2 inch (13mm) per second. If the Robotic Assembly is not aligned properly or you push too hard or too quickly, damage to the Robotic Assembly and the Base Module may occur.

   **NOTE:** The Robotic Assembly should drop smoothly by itself. If it does not, check the alignment of the gears.

7. Lock the Robotic Assembly by moving the **blue lever** to the left, then toward the rear, and then to the right.
Reinstall the Cover
Align all cover tabs with the slots on the Base Module, gently push the cover down, and then slide it towards the back of the module until the spring lock engages.

Reinsert the Module in Rack
1. Using the mechanical lifter, position the Base Module in front of the rack from where it was removed and aligned it with the rack rails.
2. Slide the module onto the rack rail flanges and into the rack.
3. Tighten the recessed screws only one turn to hold the module.

Aligning and Connecting the Module
Aligning the Base Module with the other library Expansion Modules ensures that the Robotic Assembly can move freely between the modules.
NOTE: The library will not operate unless all the alignment mechanisms (except the one on the bottom module) are in the locked position.

1. At the back of the library, using the alignment lock lever, align and lock the Base Module to any Expansion Modules to which it connects.

Release the thumbscrew (1), push down the latch (2), and re-tighten the thumbscrew (3). If you encounter resistance, adjust the upper module so that the alignment mechanism pin moves into the mating hole in the lower module.

2. If necessary, verify that the lowest module in the library has its alignment mechanism in the unlocked position.

3. At the front of the library, tighten the recessed screws on both the Base Module and any adjacent Expansion Modules to secure them all to the rack.

Complete the Reinstallation

Reinstall Tape Drives

Start with the lowest tape drive bay and install upwards. Ensure that the same drive is going into its appropriate bay.
1. Holding a **tape drive** by the handle and supporting it from the bottom, position it on the alignment rails.

2. Slowly slide the tape drive into the **drive bay** until it is flush with the back of the library.

3. Finger-tighten the **blue captive thumbscrews** to secure.

4. Moving upwards, repeat Steps 1–3 for any **additional tape drives**.

---

**Reattach Cables and Cords**

1. Reconnect the **expansion interconnect cables** (2) from the Base Module to any adjacent Expansion Modules.

2. Reconnect the **Ethernet management cables** (3).

3. Reconnect the **SAS/FC cables** (4) to the tape drives.

4. If you removed one earlier, reinsert the **USB device** (5).

5. Reconnect the **AC power cords** (1) to the power supplies.
Reinstall Tape Magazines

Reinstall the previously removed tape magazines (and tapes) into the Base Module.

1. Using the magazine **access handle** and supporting it underneath, position the magazine on the alignment rails of the appropriate bay.

2. Slide the **magazine** into the module.

3. Repeat **Steps 1–2** for the **other magazine**.

Verify the Library Configuration

Power ON the library and check the following:

- Verify that the library powers ON and initializes correctly, and that the status is **Ready**.
- Check the library configuration settings related to the additional storage slots, mailslots, and tape drives. Update the settings if necessary.
- If the UID LEDs are still illuminated, deactivate them using the RMI.

It is recommended that you always update the library to the latest firmware version. You can update firmware from the RMI (**Maintenance > Software Upgrades > System Firmware**) or the OCP (**Maintenance > Software Upgrades**).

---

**Replace the Base Module Front Bezel/OCP**

**IMPORTANT:** Review “Electrostatic Discharge” in the “Preface” before replacing a library component.
Power Off the Library

If the library is still powered on:

1. From the front panel, press and hold the **power button** for three (3) seconds.

   ![Power Button](image)

   **NOTE:** If the library does not perform a soft shutdown, press and hold the power button for ten (10) seconds.

2. Verify that the **Robotic Assembly** is in its parked position.
3. Verify that all **host processes** are idle.

Remove the Tape Magazines

1. To manually release the magazine, insert a small flat-head screwdriver or Torx driver into the appropriate magazine release hole and gently push the tab in.

   ![Screwdriver Release](image)

   **IMPORTANT:** Do not exert force once you encounter resistance. Doing so can damage the device.

2. Supporting it underneath, remove the **tape magazine**.

   ![Tape Magazine](image)

   **NOTE:** Do not remove the tape cartridges from the magazine as they need to be in the same slot locations in the new module.

3. Repeat these process for the **other** magazine.
Remove the Bezel

1. Insert a small flat-head or Torx screwdriver into one the two silver bezel release holes at bottom of the center of the bezel.
2. Push the screwdriver until the bezel is released.
   Slightly move that side of the bezel out to prevent it from relatching.
3. Insert the screwdriver into the other hole and push it in.
4. Swing the bottom of the bezel up to release it.
   NOTE: Pull gently to avoid damaging the OCP cable. Note where the OCP cable is located, routed, and attached.
5. Disconnect the OCP cable.

Install the Bezel

1. Attach the OCP cable of the new bezel.
2. Place the top tabs of the bezel into the slots in the top slots of the module.
3. Rotate the bezel bottom inward until it snaps in place.

Reinstall Tape Magazines

Reinstall the previously removed tape magazines into the Base Module.

1. Using the magazine access handle and supporting it underneath, position the magazine on the alignment rails.
2. Slide the magazine into the module.
3. Repeat Steps 1–2 for the other magazine.

Power On the Library

Power on the library by pressing the power button just below the OCP display. The green light illuminates.

When the library is powered on, it inventories the tape cartridges in the magazines, checks the firmware version on all modules, configures the tape drives, confirms the presence of the existing modules, and searches for any new modules.
Troubleshooting

This appendix provides troubleshooting steps for your NEO.

Topics in Troubleshooting:

- Fibre Channel Connection Problems
- Detection Problems After Installing a SAS Drive
- Operational Problems
- Performance Problems
- Finding Event Information
- Unlocking a Magazine
- Unloading a Stuck Tape
- Returning the Robotic Assembly to the Base Module
- Running Library Tests

Fibre Channel Connection Problems

Use the RMI Status > Drive Status page to check the link connection for your tape drive.

- If the RMI page shows **Logged Out**:
  - Check that the Fibre speed is set to **Automatic** or that the correct Fibre speed is selected. If you are unsure of the speed of the HBA or switch that the drive is connected to, try **Automatic**.
  - Check that the correct port type, **Fabric** or **Loop**, is selected. Loop requires additional configuration. If you are unsure of the correct port type, try **Automatic**.
  - If the RMI page shows **No Link**, the Speed Status is a dash (-), and the Link LED on the back of the drive is OFF, then the speed is probably set incorrectly. Try setting the speed to **Automatic**.

If there are still issues, change the port type to **Auto Detect**.

- If the RMI page shows **No Light**:
  - The cable is not plugged in correctly. Check that it is connected correctly to Port A of the tape drive.
  - The cable is damaged. FC cables are delicate. If the cable has been bent or twisted sharply, it might be broken and must be replaced.

- If the RMI page shows **ALPA Conflict**, there might be a conflict with the ALPA address on Loop ports.

Select **Soft** for the Loop mode to allow the system to select an available address each time the tape drive connects to the FC fabric. If your server configuration does not support changing addresses, try using the **Hard Auto-Select** option for the Loop mode. This allows the system to select an available address when it first connects, and then retain that address for future connections.
Detection Problems After Installing a SAS Drive

Problems encountered after installation are often caused by either improper SAS cable connections, application software configuration errors, or an incorrectly configured operating system. If the application software or operating system does not communicate with the library after installation, determine the extent of the detection problem:

- Does the application software detect the tape drive?
- Does the application software detect the library?
- Does the operating system detect the tape drive?
- Does the operating system detect the library?
- Does the operating system detect the library, but list it as a generic device?

Based on the extent of the detection problem, check the following:

- If neither the application software nor operating system detects the tape drive, or they do not detect both the tape drive and the library:
  - Verify that all SAS cables are securely connected on both ends. If the mini-SAS connectors that connect to the tape drive (and some HBAs) will not plug in, check the key. The mini-SAS connector on the tape drive is keyed at location four, which is the standard location for end devices. If the connector on the cable is keyed in a different location, not only will the connector not plug in, but the cable probably will not work.
  - Check the length and integrity of your SAS cabling. For reliable operation, do not use a SAS cable longer than six meters. Do not use a cable adapter or converters between the HBA and the library.
  - Check the SAS connectors for damage or debris.
  - Verify that your HBA is supported by the host computer and qualified with the library.
  - Verify that your HBA has the latest firmware.

- If the application software or operating system detects the tape drive, but not the library:
  - Verify that multiple LUN support is enabled on the HBA. The library uses two Logical Unit Numbers (LUNs) to control the tape drive (LUN 0) and robotic (LUN 1). The library requires an HBA with multiple LUN support and multiple LUN support must be enabled on the host computer. When multiple LUN support is not enabled, the host computer can see the tape drive, but not the library.

  NOTE: Many RAID or array controllers do not provide multiple LUN support.

- If the application software or operating system does not detect any devices on the HBA:
  - Verify that the SAS host adapter is installed correctly. Refer to the manual that came with your host adapter for installation and troubleshooting instructions. Pay particular attention to any steps describing configuration settings. Make sure that the host adapter is properly seated in the motherboard slot and the operating system correctly detects the host adapter.
  - Verify that the proper device driver is installed for the SAS host adapter.

- If the library is detected by the operating system, but not by the application software:
  - Refer to the documentation included with your backup application for instructions on how to verify proper installation. Some backup software packages require an additional module to communicate with the robotics.
• If the library is detected by the operating system, but is listed as an unknown or generic device:
  Make sure that the proper device driver, if applicable, is installed for the device. Check your software provider's website for the latest drivers and patches.

  **NOTE:** Many backup applications use their own drivers. Before installing a driver, make sure it is not in conflict with the application software.

If you continue to have problems with a SAS library, check the following:
• Ensure that the library is compatible with the SAS host adapter and backup application you plan to use.
• Verify that your HBA is supported by the host computer and qualified with the library.
• Ensure you are using a compatible, high-quality cable.

### Operational Problems

#### Power Problems

<table>
<thead>
<tr>
<th>Problem</th>
<th>Solution</th>
</tr>
</thead>
<tbody>
<tr>
<td>Device does not power on.</td>
<td>• Check all power cord connections.</td>
</tr>
<tr>
<td></td>
<td>• Check the LEDs on the power supplies to verify that they are working.</td>
</tr>
<tr>
<td></td>
<td>• Make sure the power button on the front panel has been pressed, and the green <strong>Ready</strong> LED is lit.</td>
</tr>
<tr>
<td></td>
<td>• Make sure the outlet has power. Try another working outlet.</td>
</tr>
<tr>
<td></td>
<td>• Replace the power cord.</td>
</tr>
</tbody>
</table>

| No message appears on the OCP display. | • Check all power cord connections.                                      |
|                                        | • Check the LEDs on the power supplies to verify that they are working.  |
|                                        | • Make sure the power button on the front panel has been pressed, and the green **Ready** LED is lit. |
|                                        | • Make sure the outlet has power. Try another working outlet.             |

#### OCP Alerts and Errors

<table>
<thead>
<tr>
<th>Problem</th>
<th>Solution</th>
</tr>
</thead>
<tbody>
<tr>
<td>The OCP display is a warning or error icon.</td>
<td>Tap the icon to see more information about the event on the LCD.</td>
</tr>
<tr>
<td>The OCP displays an error code.</td>
<td>Look up the error code, try to resolve the failure, and power cycle the library (see Appendix B, “Event Codes and Acronyms”).</td>
</tr>
</tbody>
</table>
## Tape Movement Problems

<table>
<thead>
<tr>
<th>Problem</th>
<th>Solution</th>
</tr>
</thead>
</table>
| Tape stuck in drive. | Try the following steps, in this order, to remove the stuck tape.  

**NOTE:** The tape drive must rewind the tape before ejecting it. This can take as long as five minutes, depending on how much tape must be rewound. Once the tape is rewound, the eject cycle will take fewer than 16 seconds.  

The Ready light flashes while the tape rewinds. Wait for the tape to finish rewinding before attempting another operation.  

Attempt to unload the tape from your backup software.  

Shut down the backup software and stop the operating system's removable storage services. From the RMI Operation > Move Media page, attempt to unload or move the tape to a slot.  

Power down the library, disconnect the cable from the drive, power up the library, and wait until the tape drive is idle or ready. From the RMI Operation > Move Media page, attempt to unload or move the tape to a slot.  

From the RMI Operation > Force Drive Media Eject page, attempt a force eject or emergency unload operation.  

**IMPORTANT:** Inspect the tape cartridge that was stuck. Damage or misplaced labels on the cartridge could have caused the load/unload failure. Discard any tape cartridge found to have issues. |
| Tape cannot be removed from storage slot. | 1. Unlock the magazine from the RMI Operation > Open Magazine page (or manually) and open it to access the storage slot.  

2. Grasp the cartridge and remove it from the storage slot. Some tapes need to be inserted and removed several times to condition them for free movement in and out of the magazine.  

3. Check the barcode label and verify that it is secure to the cartridge.  

4. Check the cartridge for damage.  

5. Check the storage slot for damage. |
## Media Problems

<table>
<thead>
<tr>
<th>Problem</th>
<th>Solution</th>
</tr>
</thead>
</table>
| Cleaning or data cartridge incompatible with drive.                    | • Check the event log to see which cartridge is incompatible.  
• Make sure you are using data and cleaning cartridges that are compatible with the drive and model of your device and that you are using the correct cartridge type for the operation. The device automatically unloads incompatible cartridges, the **Attention** LED flashes. Export the media. |
| Cannot write to or read from tape.                                     | • Make sure that the cartridge is not a WORM cartridge that has already been used.  
• Make sure that the cartridge is write enabled (move the write-protect switch to the enabled position).  
• Make sure the data cartridge is compatible with the drive model. LTO tape drives can read data cartridges from two generations back and write to data cartridges one generation back.  
• Make sure you are using an Ultrium cartridge that has not been degaussed. **Do not degauss Ultrium cartridges!**  
• Make sure that the cartridge has not been exposed to harsh environmental or electrical conditions and is not physically damaged in any way.  
• Many backup applications do not read or write to cartridges that were created using a different backup application. In this case, you may have to perform an erase, format, or label operation on the cartridge.  
• Make sure you understand any data protection or overwrite protection schemes that your backup application may be using, which could prevent you from writing to a given cartridge.  
• Retry the operation with a different, known good tape.  
• Clean the tape drive from the RMI **Operation > Clean Drive** page. |

## Attention LED is Lit

<table>
<thead>
<tr>
<th>Problem</th>
<th>Solution</th>
</tr>
</thead>
</table>
| Both the **Attention** and **Clean** LEDs are lit.                      | This is most likely caused by a dirty drive that cannot read a tape and marks the tape invalid.  
Log into the OCP or RMI and check the event log to see which drive has reported that it needs cleaning. Clean the drive with an approved Ultrium cleaning cartridge. |
| A particular cartridge triggers the **Clean** LED.                     | Remove the cartridge from the library.                                                                                                                                                                   |
| A cartridge recently imported from a different environment is causing issues. | Media that is moved from one environment to another can cause issues until it has acclimated to the new conditions. A cartridge should be acclimated for at least 24 hours before being used, particularly if it has been stored at a substantially different temperature or level of humidity than the library. |
## Inventory Problems

<table>
<thead>
<tr>
<th>Problem</th>
<th>Solution</th>
</tr>
</thead>
</table>
| The Attention LED is lit but the Clean LED is not lit after a cartridge load. | The library was unable to complete the requested operation with the selected tape cartridge.  
  - Use only cartridges that are compatible with the drive type.  
  - Use the correct type of cartridges for the operation. For example, use a cleaning cartridge for cleaning.  
  - Make sure you are using an Universal cleaning cartridge. |
| The Attention LED is lit but the Clean LED is not lit after a cartridge load. | The cleaning cartridge has expired. A cleaning cartridge expires after 50 cleaning cycles. |
| A particular cartridge sets off the Attention LED and possibly the Clean LED. | Retry the operation with a different cleaning cartridge.  
  If the Attention LED is cleared and the drive has been cleaned, and then immediately re-displays each time a particular cartridge is reloaded, that cartridge should be suspected as being defective.  
  - If this occurs, export the cartridge and load a known good cartridge.  
  - In some cases, a cartridge can be worn out, have a defective Cartridge.  
  - Memory, or have been formatted as a Firmware Upgrade Cartridge.  
  - Any cartridge that is suspected of being defective or contaminated should NOT be reused in any drive.  
  - If the bad cartridge is a cleaning cartridge, it might be expired. |

## RMI Network Connection Problems

<table>
<thead>
<tr>
<th>Problem</th>
<th>Solution</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cannot connect to the RMI.</td>
<td></td>
</tr>
</tbody>
</table>
  - Verify that the Ethernet cable is connected to the Base Module’s controller board management port and to the LAN.  
  - Verify that the link LED on the RJ45 (LAN) connector is lit when the device is powered up. If the LED is not lit, the device is not communicating with the LAN. See your network administrator for help.  
  - Verify that the device has been configured with a valid static network address or DHCP has been enabled so the device can obtain a network address. If using DHCP, write down the device's network address from the OCP login screen. If the device did not obtain a valid address via DHCP, verify that the DHCP server is up and the library has network access to it. If necessary, set a static network address instead.  
  - Enter the library’s IP address into the address bar of a web browser connected to the same LAN as the device. If the RMI web page does not display, ping the device's IP address. If the ping fails, verify that the device has a valid network address and that there are no firewalls or other obstructions to network traffic between the computer with the web browser and the device. See your network administrator for help. |
**Cleaning Problems**

<table>
<thead>
<tr>
<th>Problem</th>
<th>Solution</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cannot load the cleaning cartridge.</td>
<td>• Make sure you are using an Ultrium cleaning cartridge.</td>
</tr>
<tr>
<td></td>
<td>• Make sure the cleaning cartridge has not expired. A cleaning cartridge expires after 50 cleaning cycles.</td>
</tr>
<tr>
<td></td>
<td>• Power cycle the library.</td>
</tr>
</tbody>
</table>

**Performance Problems**

The process of backing up files involves many system components, from the files in the file system on the disk, through the backup server, and out to the library, all managed by software running on an operating system. The backup process can only run as fast as the slowest component in the system.

Performance issues are solved by identifying and addressing performance limitations in your system. See sections below for the following potential performance limitations:

- **Average File Size**
- **File Storage System**
- **Connection from the Backup/Archive Host Server to the Disk Array**
- **Backup/Archive Server**
- **Backup/Archive Software and Method**
- **Connection from the Archive/Backup Host Server to the Library**
- **Media**

**Average File Size**

The hard drive must seek to the position of a file before it can start reading. The more time the disks are seeking to files, the lower the performance. Therefore, if the average file size is small, the read performance will be lower.

To determine the average file size, divide the size of the backup by the number of files.

If the average file size is small (64 KB or less), consider using a sequential, image, or block backup method that backs up the whole hard drive or LUN image instead of individual files. The trade off for using one of these methods is that you might only be able to restore the entire image instead of individual files.

**NOTE:** File fragmentation also causes excessive drive seeking, which lowers performance, so ensure that files are regularly defragmented.

**File Storage System**

The file storage system determines the organization of the files on the disks. Using RAID controllers to spread files over multiple disks can improve performance because some disks can be seeking while others are reading. Storing files on a single non-RAID disk results in the slowest performance while storing files on a high-end disk array results in the fastest performance.

Converting standalone disks to RAID can improve performance.
Connection from the Backup/Archive Host Server to the Disk Array

The connection between the host server and the disks determines how much data can be transferred from the disks to the host computer at a time. A connection with insufficient bandwidth cannot provide enough data for the tape drives to write at full speed. For optimum performance, the storage subsystem must be able to provide data at the tape drive’s maximum transfer rate.

Backup systems using a lower speed Ethernet network should use multiple network connections.

Backup/Archive Server

The backup server must have enough RAM and processor power to transfer the files from the disk to the tape drive, in addition to running the backup or archive software and any other processes.

Check the RAM and processor usage during a backup operation. If they are operating at capacity, adding more RAM or processor capability can improve performance.

Backup/Archive Software and Method

Each backup method has its own impact on performance, depending on how well it can keep data streaming to the tape drive. In most cases, native applications don’t have the features required to maximize performance for LTO tape drives. It is recommended to use a full-featured backup or archive application with this library.

File-by-file backup or archive methods provide the best restore performance if you only need to restore individual files. However, if the average file size is small, file-by-file methods will significantly reduce performance.

Disk image, flash, or sequential backup methods provide the fastest performance because they back up an entire disk, partition, or LUN, which minimizes disk seeking. The disadvantage is that backup and restore operations work on an entire disk, partition, or LUN. You might not be able to back up a subset of files or restore a single file. If you can restore a single file, the restore process will be slow.

Database backup performance varies based on the use model. To improve performance when backing up data from a database:

- Use specific backup agents for the database.
- Use the latest versions of the databases.
- Do not back up individual mailboxes.
- Do not back up specific records or do a record-by-record backup.
- Do not back up when the database is in heavy use.

Connection from the Archive/Backup Host Server to the Library

For the best performance, the connection from the host server to the library must have enough bandwidth to provide enough data to keep the tape drive streaming. Current LTO tape drives take advantage of some of the fastest interfaces available so the type of interface used to connect the library to the host server is not likely to be the cause of a performance issue. However, issues with cables and connectors can limit performance.

Do not exceed recommended cable lengths.
Media

The type and condition of the media also affect backup performance. For best performance, use media that is the same LTO generation as the tape drives.

Finding Event Information

You can find error codes by viewing log files in the RMI Maintenance > Logs and Traces > View Logs page or downloading support tickets from the RMI Maintenance > Download Support Ticket page. See Logs and Traces on page 107 or Download Logs and Traces on page 108 in Chapter 6, “Remote Management Interface.”

Unlocking a Magazine

It is recommended that you unlock a tape magazine using the RMI. If this fails, or if a magazine needs to be removed when the power to the device is off, you can release a magazine manually. Only one magazine can be open at a time.

NOTE: As a best practice, perform this procedure while applications are idle. While the magazine is extended, the library Robotic Assembly cannot move media.

For details see the following:

• Using the RMI to Unlock Magazines
• Using the Magazine Manual Release

Using the RMI to Unlock Magazines

Log in as an administrator.

On the RMI Home page, click Open Magazine.
Click **Open** in the left or right magazine column within the module containing the magazine to be opened.

![Operation > Open Magazine](image)

A message box indicates when the magazine has been unlocked. The RMI Open Magazine page shows that the magazine is now unlocked.

**NOTE:** If not removed, the magazines and the mailslot relock after 30 seconds (or 5 minutes if so configured).

### Using the Magazine Manual Release

**IMPORTANT:** Do not exert force once you encounter resistance. Doing so can damage the device.

To unlock an entire magazine, use a small screwdriver to press the manual release tab located at the outside edge in the center of the door hinge.

![Unlocking a Magazine](image)

### Unloading a Stuck Tape

If the tape is stuck in a tape drive, eject the tape from the drive from the RMI **Operation > Force Drive Media Eject** page.

If a tape is stuck in a magazine, open the magazine, grasp the cartridge, and pull it out of the storage slot.

### Returning the Robotic Assembly to the Base Module

If you have powered off the library and the Robotic Assembly did not return to its park position in the Base Module behind the OCP:
1. Power the library back on by pressing the **power button** on the Base Module.

2. From the RMI, return the Robotic Assembly to its park position using the RMI **Maintenance > Move Robotic to Base Module** page.

3. Power off the library again by pressing the **power button** on the Base Module and holding for three seconds.

If the Robotic Assembly is still not in the Base Module, use one of the procedures in the following two sections:

- Robotic Assembly Stopped Near Base Module or Between Modules
- Robotic Assembly Stopped Far From Base Module or Cannot Move Vertically

### Robotic Assembly Stopped Near Base Module or Between Modules

Remove the front bezel from the Base Module, the Expansion Module containing the Robotic Assembly, and any modules in between as needed. See **Replace the Base Module Front Bezel/OCP on page 163**.

Insert a small flat-head screwdriver into the screwdriver relief on the right rear bearing block of the Robotic Assembly.

![Image of a Robotic Assembly with a screwdriver in its screwdriver relief]

Turn the screwdriver to manually operate the Robotic Assembly gear train and move the Robotic Assembly into the Base Module.

Once inside the Base Module, unlock the Robotic Assembly. Standing at the front of the module, move the blue lever to the left, then toward you, then to the right.

Reinstall the bezels previously removed.

Replace the Robotic Assembly and Spooling Mechanism. See **Replace the Robotic Assembly and Spooling Mechanism on page 152 in Chapter 7, “Service and Upgrades.”**

### Robotic Assembly Stopped Far From Base Module or Cannot Move Vertically

The library should already be powered off. Disconnect the power supply cables from all of the modules.

Manually unlock the left Base Module magazine using the manual release on the left side. Supporting the magazine on the bottom, remove the left magazine from the Base Module.
Using plastic-handled scissors, reach through the left magazine opening and carefully cut the spooling cable.

Replace the Robotic Assembly and Spooling Mechanism. See Replace the Robotic Assembly and Spooling Mechanism on page 152 in Chapter 7, “Service and Upgrades.” Use these exceptions:

- Extend the Expansion Module containing the Robotic Assembly while carefully guiding the free spooling cable.
- Remove the Robotic Assembly from the Expansion Module and set it aside.
- Slide the Expansion Module back into the rack and secure it.
- Remove the Base Module per the instructions.
- Remove the old Spooling Mechanism from the Base Module.
- Install the new Robotic Assembly and Spooling Mechanism and complete the procedure.

### Running Library Tests

The library provides tests to verify library operations. The following tests are available in the RMI:

**NOTE:** The System, Slot-to-Slot, Robotics, and OCP tests are also available in the OCP.

- **System Test** – Exercises overall library functionality by moving cartridges within the library. Cartridges are returned to their original location. See page 103.
- **Slot-to-Slot Test** – Randomly exchanges cartridges within the library. Cartridges are NOT returned to their original locations. See page 103.
- **Element-to-Element Test** – Moves a cartridge to a specific element and then returns it to its original location. See page 104.
- **Position Test** – Moves the Robotic Assembly vertically between two element locations. The test does not move cartridges. See page 105.
- **Wellness Test** – Exercises a general health check on the library functionality by running the following partial tests:
  - **Basic Hardware Review**
  - **Robotics Initialization Test**
  - **Barcode Scanning Test**
- **Move Media Test**  
  See page 106.

- **Robotic Test** – Exercises all Robotic Assembly movements and sensors. See page 107.

- **OCP Test (with LCD Adjustment Reset)** – Illuminates each of the front panel LEDs and enables the OCP LCD contrast and brightness to be reset back to the defaults. See page 107.
Event Codes and Acronyms

This appendix details the event codes and key acronyms for the NEO.

Topics in Event Codes and Acronyms:
- Event Codes
- Warning Events
- Configuration Change Events
- Informational Events
- Acronyms and Abbreviations

### Event Codes

<table>
<thead>
<tr>
<th>Event Code</th>
<th>Message Text and Description</th>
<th>Details and Solution</th>
</tr>
</thead>
<tbody>
<tr>
<td>2000</td>
<td>Failed to move cartridge.</td>
<td>Verify the source and destination elements and retry the move operation.</td>
</tr>
<tr>
<td>2002</td>
<td>The initial module discovery (detection of expansion modules) failed.</td>
<td>Verify that all expansion modules are powered on and that the expansion interconnect cables are properly installed.</td>
</tr>
</tbody>
</table>
| 2003       | The library's temperature has exceeded the critical limit. | Check to ensure:  
  - The chassis fan is functioning in each module present.  
  - The drive cover plates are installed where no drive exists.  
  - All power supplies are installed.  
  - The ambient room temperature is within limits. |
<p>| 2004       | Library Startup Failure.     | Verify that magazines are closed, cartridges are fully seated, and that there are no Robotic Assembly obstructions. Verify all modules are powered and any expansion modules are cabled correctly with the inter module cable. Verify there is a top and bottom cover properly installed on the library. Also, verify the module alignment locks (at rear of module) are in the proper position. If the robot moves front to back, but not vertically, the robot shipping lock could be positioned incorrectly and should be moved to either the fully locked or fully unlocked position. If the error persists, review library events for more information and/or reboot the library. |
| 2005       | Robotic spooling cable failure. | Ensure that the spooling cable is fully seated in the base module and connected correctly to the Robotic Assembly. |
| 2006       | Cable to Spooling Mechanism has failed. | Ensure that the Spooling Mechanism is fully seated in the base module and connected correctly to the Robotic Assembly. |</p>
<table>
<thead>
<tr>
<th>Event Code</th>
<th>Message Text and Description</th>
<th>Details and Solution</th>
</tr>
</thead>
<tbody>
<tr>
<td>2009</td>
<td>Library test failed due to Robotic Assembly problem.</td>
<td>Review test requirements and retry the test, if the test continues to fail check for robotic obstructions or other robotic problems. For proper operation the robot must be able to reach the very bottom of the library. Verify there are no obstructions at the bottom of the library or on the bottom cover of the library in the path of the robot. To check for obstructions at the bottom of the library, first power off the library by pressing the front power button for 5 seconds and select the Default Park location. Once the library is powered off, remove the left magazine of the lowest library module, and verify the entire area of the bottom cover is free of any objects that might obstruct the robot's path. After clearing any obstructions, replace the magazine, power the library on, and after the library finishes initialization and inventory, verify no further critical events were generated.</td>
</tr>
<tr>
<td>2010</td>
<td>Library test failed due to Spooling Mechanism defect.</td>
<td>Ensure that the Spooling Mechanism is fully seated in the base module and installed correctly to the Robotic Assembly.</td>
</tr>
<tr>
<td>2011</td>
<td>Drive Power Board has failed. Due to this failure some drives maybe powered off.</td>
<td>Ensure the Drive Power Board is fully seated in the module and power cycle the library.</td>
</tr>
<tr>
<td>2012</td>
<td>Multiple bottom covers detected.</td>
<td>Remove all bottom covers except from the bottom module in the library.</td>
</tr>
<tr>
<td>2013</td>

| 2040       | Wellness test failed with critical error. | • Check for additional events that might provide an indication of the reason for the failure.  
• Retry the Wellness test. |
<p>| 2041       | Wellness test failed because of unit lock failed. | Ensure that the alignment mechanism is engaged in every module that is above another module in the library. |
| 2042       | Wellness test failed because top cover is missing. | Install the top cover on the top module of the library, also check the module interconnect cabling and module power cabling. If the base module cannot detect both a top and bottom cover, the robot will not move. |
| 2043       | Wellness test failed because bottom cover is missing. | Install the bottom cover on the bottom module of the library, also check the module interconnect cabling and module power cabling. If the Base Module cannot detect both a top and bottom cover, the robot will not move. |
| 2044       | Wellness test failed because Drive Power Board has failed. | Ensure the Drive Power Board is fully seated in the module and power cycle the library. |
| 2045       | Wellness test failed because move media test failed. | The minimum requirements for the Wellness are at least one unloaded drive and one data cartridge compatible with that unloaded drive installed in the library. If no drives are unloaded or no compatible media is found, the test fails and an error event will be generated. To view event details from RMI, click on the event, and then view all of the event details to see what elements were involved in the move failure. Additionally, check for obstructions in the pathway of the robot such as a cartridge sticking out. Verify module alignment and frame alignment. Check if Robotic Assembly stuck in lock mechanism, move Robotic Assembly apart from lock mechanism and enable lock mechanism correctly. |
| 2046       | Wellness test failed because drive communication test failed. | Remove and reseat the drive canister to ensure that the drive is fully seated. If the issue persists then reset the drive. Use the library RMI to pull a drive support ticket and check the device analysis section for more help (HPE Library and Tape Tools must be installed to view support ticket). |
| 2047       | Wellness test failed because the barcode scanning test failed. | Verify that there is no obstruction in front of the barcode scanning module on the cartridge table located on the Robotic Assembly. If the error persists replace the Robotic Assembly. For proper operation the robot must be able to reach the very bottom of the library. Verify there are no obstructions at the bottom of the library or on the bottom cover of the library in the path of the robot. To check for obstructions at the bottom of the library, first power off the library by pressing the front power button for 5 seconds and select the Default Park location. Once the library is powered off, remove the left magazine of the lowest library module, and verify the entire area of the bottom cover is free of any objects that might obstruct the robot’s path. After clearing any obstructions, replace the magazine, power the library on, and after the library finishes initialization and inventory, verify no further critical events were generated. |</p>

| 4061       | Key not found on KMIP server.                                                               | Verify that the requested key is available on the KMIP server. Check the KMIP server logs for additional details. |
| 4062       | Key creation on KMIP server failed.                                                         | Check the KMIP server logs for additional details about why key creation failed.       |
| 4063       | KMIP configuration invalid.                                                                | Use the KMIP configuration wizard to verify the KMIP configuration.                    |
| 4064       | KMIP feature not licensed.                                                                 | Disable KMIP or install appropriate license for KMIP feature.                          |
| 4065       | A tape alert flag was reported by a drive.                                                  | Check event details for additional information.                                       |
| 4067       | Cleaning cartridge will soon expire and should be replaced.                                | Replace the cartridge.                                                                |
| 4068       | No cleaning cartridge found.                                                               | Auto cleaning is enabled, but the library contains no labeled cleaning cartridge. The library was unable to perform the auto clean function for one or more drives. Install a valid and labeled cleaning cartridge and then perform a load and unload on the drive that needs cleaned to initiate the auto cleaning. |
| 4071       | Power supply fan failed.                                                                    | Verify the power supply fan is spinning and ensure there are no obstructions in the fan. |
| 4072       | No cleaning cartridge in partition available for auto cleaning.                              | Auto cleaning is enabled, but the partition contains no labeled cleaning cartridge. The library was unable to perform the auto clean function for one or more drives in this partition. Install a valid and labeled cleaning cartridge into the partition and then perform a load and unload on the drive that needs cleaned to initiate the auto cleaning. |
| 4073       | Medium source element empty.                                                               | Check the source slot visually and rescan inventory. Additionally check for valid and readable barcode label. |
| 4074       | Medium source element empty.                                                               | Check the source slot visually and rescan inventory. Additionally check for valid and readable barcode label. |
| 4075       | Cartridge lost while extracting it from slot/drive.                                         | Check the source/destination element and ensure that there are no obstructions in the pathway of the robot. |
| 4077       | Unlocking the right magazine failed.                                                        | Reboot the library and retry the operation. If the error persists replace the chassis. If the magazine needs to be removed to get access to the tape cartridges, first power down the device and then release the magazine manually. Only one magazine can be open at a time. |</p>

<td>Unlocking the mailslot failed.</td>
<td>Reboot the library and retry the operation. If the error persists replace the chassis. If the mailslot needs to be removed to get access to the tape cartridges, first power down the device and then release the entire magazine manually. Only one magazine can be open at a time.</td>
</tr>
</tbody>
</table>
| 4080       | Wellness test failed with warning. | • Check for additional events that might provide an indication of the reason for the failure.  
• Verify that the library meets the requirements of the test.  
• Retry the Wellness test.  
• Run the System test and then check for events with additional information.  
• Verify that media is loaded in the library. |
| 4083       | Library not properly calibrated. This may cause media movement failures. | The library needs to be re-calibrated. Ensure the library firmware is up to date. If this event persists after a reboot of the library, or if calibration does not begin automatically upon restart, manually initiate calibration via the Maintenance > Auto Calibration RMI menu. |
| 4085       | Too many retries of drive command needed because of Unit Attention or Not Ready condition. | • Check for additional events that might provide an indication of the reason for the failure.  
• Check the data cartridge in the drive for damage and wear.  
• Wait for drive operation to complete and then retry the command. |
<p>| 4086       | Move operation failed due to the inability accessing the database. | Ensure the network the library is connected to is operating normally and ensure the library is running the latest firmware. Library needs reboot. |
| 4088       | Library not properly calibrated. This may cause media movement failures. | Some chassis calibration data does not match to installed robot. Please reboot the library to initiate a re-calibration of the system. Ensure the library firmware is up to date. If this event persists after a reboot of the library, or if calibration does not begin automatically upon restart, manually initiate calibration via the Maintenance &gt; Auto Calibration RMI menu. |
| 4089       | Auto calibration of one or more modules failed. Library not properly calibrated. This may cause media movement failures. | The library needs to be re-calibrated. Ensure the library firmware is up to date. This event indicates that one or more of the gray calibration targets located on the library magazines could not be used in calibration. Inspect the calibration targets in each module and then repeat the auto-calibration routine via the Maintenance &gt; Auto Calibration RMI menu. |
| 4090       | Auto calibration of one or more modules failed. Library not properly calibrated. This may cause media movement failures. | The library needs to be re-calibrated. Ensure the library firmware is up to date. This event indicates that one or more of the gray calibration targets located on the library magazines could not be used in calibration. Inspect the calibration targets in each module and then repeat the auto-calibration routine via the Maintenance &gt; Auto Calibration RMI menu. |
| 4091       | Auto calibration of one or more modules failed. Library not properly calibrated. This may cause media movement failures. | The library needs to be re-calibrated. Ensure the library firmware is up to date. This event indicates that one or more of the gray calibration targets located on the library magazines could not be used in calibration. Inspect the calibration targets in each module and then repeat the auto-calibration routine via the Maintenance &gt; Auto Calibration RMI menu. |
| 4092       | Installed robotic does not support auto calibration. | If move errors are occurring, the Robotic Assembly needs to be replaced with a robot that supports auto-calibration. If this event persists after replacing the robot, manually initiate calibration via the Maintenance &gt; Auto Calibration RMI menu. |</p>

| 4095       | Library test failed. Not enough valid cartridges available for testing.                        | • Review the cartridge requirements for the test and then ensure that sufficient cartridges are available in the required locations to run the test.  
• Rerun the test. |
| 4097       | Drive port configured to NPIV but failed to negotiate with Fibre channel switch.              | Verify that your Fibre channel switch is supporting NPIV and that this option is enabled for the port connected to the failing tape drive. Note: It may be necessary to disconnect and reconnect the port after changing NPIV configuration of the switch. Disable control path failover if NPIV can't be supported by your infrastructure. |
| 4098       | System time synchronization via SNTP failed.                                                   | Check for valid SNTP server address in Time configuration. If correct, ensure that server reachable from your network and not blocked by Firewall. |
| 4099       | An unexpected reset of robotics has been detected.                                             | Ensure that the spooling cable is fully seated in the Base Module and connected correctly to the Robotic Assembly. If the error re-occurs replace the Robotic Assembly. |
| 4110       | Drive disabled due to an incompatible Drive Power Board.                                       | Remove incompatible Drive Power Board. Only install Drive Power Boards that are compatible with the library. |
| 4113       | Move Cartridge operation failed due to cartridge not properly taken over from Drive.           | Check for labels or cartridge misalignments that would prevent the cartridge from coming out of the slot or drive. |
| 4117       | Drive disabled because no power supply available in this module.                              | Remove all affected Drives, insert and power up at least one power supply to the failing module. Wait ten seconds and put the drives back into the module. |
| 4118       | Drive disabled because no Drive Power Board available in this module.                         | Power down your library stack. Install compatible Drive Power Board to the failing module. Restart library stack. |
| 4119       | Drive disabled because internal IP address for communication unknown.                          | Remove affected drive, wait ten seconds and put it back into the module.  Alternatively reboot Library stack. |
| 4120       | No empty drive available for system test.                                                      | Ensure at least one unloaded, ready-to-use tape drive is installed and powered on in the library. |
| 4121       | No compatible media available for system test.                                                 | Ensure at least one piece of media compatible with the installed tape drive is available in the library. |
| 4122       | No cartridge available for slot to slot test.                                                  | Ensure at least one piece of media is available in the library. |
| 4123       | No empty slot available for slot to slot test.                                                 | Ensure at least one empty slot is available in the library. |
| 4124       | Drive or media statistics could not be retrieved when unloading the tape.                     | Check for additional warning tickets. Replace media if media related tape alert flags reported. |

Master Glossary & Acronym List

NOTE: This is a general Overland Storage glossary and acronym list. Not all items may be found in this document or be used by this product.

1000BASE-T

1000BASE-T (also known as IEEE 802.3ab) is a standard for gigabit Ethernet over copper wiring. It requires, at a minimum, Category 5 cable (the same as 100BASE-TX), but Category 5e (Category 5 enhanced) and Category 6 cable may also be used and are often recommended. 1000BASE-T requires all four pairs to be present and is far less tolerant of poorly installed wiring than 100BASE-TX.

Address

An address is a data structure or logical convention used to identify a unique entity, such as a particular process or network device.

ADI

Short for Automation/Drive Interface. Media changer (automation) devices use a private communication link for monitoring and controlling removable medium devices (drives). The standard specifies a protocol for transporting commands, data, and status between automation devices and the drives.

Algorithm

A sequence of steps designed to solve a problem or execute a process.

ATA

Short for Advanced Technology Attachment. A standard interface for connecting storage devices to a PC.

Authentication

The validation of a user’s identity by requiring the user to provide a registered login name and corresponding password.

Autonegotiation

An Ethernet feature that automatically negotiates the fastest Ethernet speed and duplex setting between a port and a hub or switch. This is the default setting and is recommended.

Autosensing

An Ethernet feature that automatically senses the current Ethernet speed setting.

Barcode

The machine-readable representation of a product code. Barcodes are read by a scanner that passes over the code and registers the product code. The width of black lines and white spaces between varies. Combinations of lines and spaces represent characters. Overland uses 3-of-9 code (Code 39) where each character is represented by 9 bars, 3 of which are wide.
Bridging

Devices that connect and pass packets between two network segments that use different communications protocol.

Bus or Channel

A common physical path composed of wires or other media, across which signals are sent from one part of a computer to another. A channel is a means of transferring data between modules and adapters, or between an adapter and SCSI devices. A channel topology network consists of a single cable trunk that connects one workstation to the next in a daisy-chain configuration. All nodes share the same medium, and only one node can broadcast messages at a time.

CA

Short for Certificate Authority. A trusted third-party in a network that issues and manages security credentials.

Cat 5 Cable

Short for Category 5, it is network cabling that consists of four twisted pairs of copper wire terminated by 8P8C modular connectors. CAT 5 cabling supports frequencies up to 100 MHz and speeds up to 100 Mbps. It can be used for ATM, token ring, 100BASE-T, and 10BASE-T networking.

Cat 5 is based on the EIA/TIA 568 Commercial Building Telecommunications Wiring Standard developed by the Electronics Industries Association as requested by the Computer Communications Industry Association in 1985.

Cat 6 Cable

Short for Category 6, it is network cabling that consists of four twisted pairs of copper wire terminated by 8P8C modular connectors made to higher standards that help reduce noise caused by crosstalk and system noise. The ANSI/TIA-568-B.2-1 specification states the cable may be made with 22 to 24 AWG gauge wire, so long as the cable meets the specified testing standards.

It is designed for Gigabit Ethernet that is backward compatible with the Category 5/5e and Category 3 cable standards. Cat 6 features more stringent specifications for crosstalk and system noise. The cable standard provides performance of up to 250 MHz and is suitable for 10BASE-T, 100BASE-TX, and 1000BASE-T (Gigabit Ethernet).

Channel

A communications path between two computers or devices.

Checksum

The result of adding a group of data items that are used for checking the group. The data items can be either numerals or other character strings treated as numerals during the checksum calculation. The checksum value verifies that communication between two devices is successful.

default gateway

The router used when there is otherwise no known route to a given subnet.

DHCP

Short for Dynamic Host Configuration Protocol. A communications protocol that lets network administrators centrally manage and automate the assignment of IP addresses on a computer network. Each system that connects to the internet/intranet needs a unique IP address.
Disaster Recovery

A strategy that allows a company to return to normal activities after a catastrophic interruption. Through failover to a parallel system or by restoration of the failed system, disaster recovery restores the system to its normal operating mode.

DNS

Short for Domain Name Service. A network service that translates domain names into IP addresses using a server that maintains a mapping of all host names and IP addresses. Normally, this mapping is maintained by the system administrator, but some servers support dynamic mappings.

Domain

A set of network resources in Windows 2000/2003/2008, such as users and groups of users. A domain may also include multiple servers on the network. To gain access to these network resources, the user logs into the domain.

Domain Name

The ASCII name that identifies the domain for a group of computers within a network.

Ethernet

The most widely installed LAN technology. 100BASE-T Ethernet provides transmission speeds of up to 100 Mbps. Fast Ethernet or 1000BASE-T provides transmission speeds up to 1000 Mbps and is typically used for LAN backbone systems, supporting workstations with 100BASE-T cards. Gigabit Ethernet (GbE) provides an even higher level of backbone support at 1000 Mbps (one Gigabit or one billion bits per second).

Ethernet Address

The unique six-digit hexadecimal (0-9, A-F) number that identifies the Ethernet interface.

Ethernet Port

The port on a network card to provide Ethernet access to the computer.

Event

Any significant occurrence or error in the system that may require notifying a system administrator or adding an entry to a log.

F_Port

A Fabric port within a Fibre Channel switch that provides a point-to-point link to a single N_Port. F_Ports are intermediate ports in virtual point-to-point links between end ports. For example, N_Port to F_Port to F_Port to N_Port using a single Fibre Channel fabric switch.

Fabric

A Fabric is a Fibre Channel (FC) that allows an active intelligent interconnection scheme to connect devices. Everything between the ports on an FC is called the Fabric. The Fabric is most often a switch or series of switches that takes the responsibility for routing.
FC-AL

Short for Fibre Channel Arbitrated Loop. An FC-AL is a Fibre Channel network in which up to 126 systems and devices are connected in a loop topology, with each transmitter connecting to the receiver of the device on its logical right. The Fibre Channel Arbitrated Loop protocol used for transmission is different from Fibre Channel switched and point-to-point protocols. Multiple FC-AL loops can be connected via a fabric switch to extend the network.

Fibre Channel

Fibre Channel (FC) is a gigabit-speed network technology which transports SCSI commands over Fibre Channel networks. Fibre Channel was primarily concerned with simplifying the connections and increasing distances, but later designers added the goals of connecting SCSI disk storage, providing higher speeds and far greater numbers of connected devices.

Firmware

Software stored in read-only memory (ROM) or programmable ROM (PROM). Firmware is often responsible for the behavior of a system when it is first switched on.

FL_port

A Fabric Loop port within a Fibre Channel switch that is capable of Fibre Channel Arbitrated Loop operations and is connected to one or more NL_Ports via a Fibre Channel Arbitrated Loop. An FL_Port becomes a shared entry point for public NL_Port devices to a Fibre Channel fabric. FL_Ports are intermediate ports in virtual point-to-point links between end ports that do not reside on the same loop, for example NL_Port to FL_Port to F_Port to N_Port through a single Fibre Channel fabric switch.

FTP

Short for File Transfer Protocol. A standard internet protocol that provides a way to exchange files between computers on the internet.

Full-duplex

A type of transmission that allows communicating systems to both transmit and receive data simultaneously.

Gateway

The hardware or software that bridges the gap between two network subnets. It allows data to be transferred among computers that are on different subnets.

Gigabit Ethernet

Also known as GigE or GbE, this Ethernet standard uses a one Gigahertz (1000 Hz) clock rate to move data.

HBA

Short for Host Bus Adapter. An HBA is an I/O adapter that sits between the host computer's bus and the Fibre Channel loop and manages the transfer of information between the two channels. To minimize the impact on host processor performance, the HBA performs many low-level interface functions automatically or with minimal processor involvement.

Half-duplex

A type of transmission that transfers data in one way at a time.
Host Name

The unique name by which a computer is known on a network. It is used to identify the computer in electronic information interchange.

Hot Swapping

The ability to add or remove powered-off tape drives to or from a system without the need to power down or interrupt client access to filesystems. Not all components are hot-swappable. Please read installation and maintenance instructions carefully.

HTTP

HTTPS

I/E Element

See Mail Slot.

Initiator Device

An initiator normally runs on a host computer. It may be either a software driver or a hardware plug-in card, often called a Host Bus Adapter (HBA). A software initiator uses one of the computer’s Ethernet ports for its physical connection, whereas the HBA will have its own dedicated port.

IP

Short for Internet Protocol. The unique 32-bit value that identifies the location of the server. This address consists of a network address, optional subnetwork address, and host address. It displays as four addresses ranging from 1 to 255 separated by periods.

Kerberos

A secure method for authenticating a request for a service used by ADS. Kerberos lets a user request an encrypted “ticket” from an authentication process that can then be used to request a service from a server. The user credentials are always encrypted before they are transmitted over the network.

In Windows 2000/XP, the domain controller is the Kerberos server. The Kerberos key distribution center (KDC) and the origin of group policies are applied to the domain.

KMIP

Short for Key Management Interoperability Protocol. A client/server communication protocol for storage and maintenance of key, certificate, and secret objects.

LAN

Short for Local Area Network. A network connecting computers in a relatively small area such as a building.
LCD
Short for Liquid Crystal Display. An electronic device that uses liquid crystal to display messages.

LDAP

LED
Short for Light-Emitting Diode. An LED is a type of diode that emits light when current passes through it. Visible LEDs are used as indicator lights on electronic devices.

Linux
A Unix-like operating system that was designed to provide personal computer users a free or very low-cost operating system comparable to traditional and usually more expensive Unix systems.

LTO
Short for Linear Tape-Open, a technology that was developed jointly by HP, IBM, and Certance (Seagate) as an open standards. It is ideally suited for backup, restore, and archive applications, and provides reliability in both stand-alone and automated environments. The tape cartridges go by the label “Ultrium.”

- Ultrium generation 3 (LTO-3) cartridge – up to 800 GB capacity and a transfer rate of 80 MB/s using 2.0:1 compression.
- Ultrium generation 4 (LTO-4) cartridge – up to 1.6 TB capacity and a transfer rate of 120 MB/s using 2.0:1 compression.
- Ultrium generation 5 (LTO-5) cartridge – up to 3.0 TB capacity and a transfer rate of 280 MB/s using 2.0:1 compression.
- Ultrium generation 6 (LTO-6) cartridge – up to 6.25 TB capacity and a transfer rate of 400 MB/s using 2.5:1 compression.
- Ultrium generation 7 (LTO-7) cartridge – up to 15.0 TB capacity and a transfer rate of 750 MB/s using 2.5:1 compression.
- Ultrium generation 8 (LTO-8) cartridge – up to 30.0 TB capacity and a transfer rate of 750 MB/s using 2.5:1 compression.

LUN
Short for Logical Unit Number. A SCSI or Fibre Channel device identifier. LUN is a subdivision of a SCSI target.

LVD
Short for Low Voltage Differential. LVD is a method of powering SCSI cables that will be formalized in the SCSI-3 specifications. LVD uses less power than the current differential drive (HVD), is less expensive, and allows for higher speeds such as those of Ultra-2 SCSI. LVD requires 3.3 volts (versus 5 volts for HVD).
MAC Address
Short for Media Access Control address, a hardware address that uniquely identifies each node of a network. In the Open Systems Interconnection (OSI) model, one of two sublayers of the Data Link Control layer concerned with sharing the physical connection to the network among several computers. Each Ethernet port has a unique MAC address.

Mail Slot
A configurable import/export slot or magazine to provide a means of exchanging tape media while the unit is still operating.

Mapping table
A table indexed by sequential LUN values, indicating the selected BUS:TARGET:LUN devices. Mapping tables are used by routers and bridges like the GEOi to perform Ethernet-to-SCSI pathing.

MD5 Algorithm
MD5 is a way to verify data integrity, and is much more reliable than checksum and many other commonly used methods.

MIB
Short for Management Information Base. A formal description of a set of network objects that can be managed using the Simple Network Management Protocol (SNMP). The format of the MIB is defined as part of SNMP.

N_Port
A Node port connects via a point-to-point link to either a single N_Port or a single F_Port. N_Ports handle creation, detection, and flow of message units to and from the connected systems. N_Ports are end ports in virtual point-to-point links through a Fabric. For example, N_Port to F_Port to F_Port to N_Port using a single Fibre Channel fabric switch.

NIC
Short for Network Interface Card. A board that provides network communication capabilities to and from a computer.

NIS
Short for Network Information Service. It is a client–server directory service protocol for distributing system configuration data such as user and host names between computers on a computer network. Sun Microsystems developed NIS; the technology is licensed to virtually all other Unix vendors.

NL_port
A Node Loop port is capable of arbitrated loop functions and protocols. An NL_Port connects via an arbitrated loop to other NL_Port and at most a single FL_Port. NL_Ports handle creation, detection, and flow of message units to and from the connected systems. NL_Ports are end ports in virtual point-to-point links through a fabric, for example NL_Port to F_Port to F_Port to N_Port using a single Fibre Channel fabric switch. In the absence of a fabric switch FL_Port, NL_Ports can communicate with other NL_Ports in virtual point-to-point links through a FC-AL open loop circuit often through FC-AL (Arbitrated Loop) hub or loop switch devices.
NTP

Short for Network Time Protocol. A protocol for synchronizing the system clocks of computers over a packet-switched network.

NVRAM

Abbreviation of Non-Volatile Random Access Memory, a type of memory that retains its contents when power is turned off.

OCP

The Operator Control Panel is the front panel of a NEO XL-Series Base Module. It consists of an LCD display, navigation buttons, operation buttons, LEDs, and USB port.

Permissions

A security category, such as no access, read-only, or read-write, that determines what operations a user or group can perform on folders or files.

Port Name

This is an eight-byte hexadecimal number, uniquely identifying a single host HBA port. It incorporates the World Wide Name and two additional bytes that are used to specify the format and indicate the port number.

Protocol

A standardized set of rules that specifies the format, timing, sequencing, and/or error checking for data transmissions.

PTP

Short for Point-to-Point. PTP is the common mode of attachment to a single host. PTP is sometimes used to attach to a Fibre Channel switch for SAN connectivity.

RMI

The Remote Management Interface is a web interface for a NEO XL-Series library that provides access via a browser to all the library configurable features, includes online help, and is easier to use than the OCP.

Router

A router is a device that enables connectivity between Ethernet network segments.

SAN

Short for Storage Area Network. Data storage connected to a network that provides network clients access to data using block level protocols. To the clients, the data storage devices appear local rather than remote. An iSCSI SAN is sometimes referred to as an IP-SAN.

SAS

Short for Serial Attached SCSI. It is a point-to-point serial protocol that replaces parallel SCSI bus technology (multidrop) and uses the standard SCSI command set. It has no termination issues, supports up to 16,384 devices (using expanders), and eliminates clock skew. It consists of an Initiator that originates device service requests, a Target containing logical units that receives device service requests, and a Service Delivery Subsystem that transmits information between the Initiator and the Target.
SCSI

Short for *Small Computer System Interface*. SCSI is an industry standard for connecting peripheral devices and their controllers to an initiator. Storage devices are daisy-chained together and connected to a host adapter. The host adapter provides a shared bus that attached peripherals use to pass data to and from the host system. Examples of devices attached to the adapter include disk drives, CD-ROM discs, optical disks, and tape drives. In theory, any SCSI device can be plugged into any SCSI controller.

**SCSI addressing**

Each device supported by a SCSI adapter has its own unique SCSI address, which dictates the device’s priority when arbitrating for access to the SCSI bus. A SCSI address of 7 has the highest priority. For a fast/wide SCSI adapter that supports up to 16 devices, the next highest priority address is 6, then 5, 4, 3, 2, 1, 0, 15, 14, 13, 12, 11, 10, 9, and 8. The narrow SCSI adapter supports up to eight devices, including itself. The SCSI address 7 has the highest priority, followed by 6, 5, 4, 3, 2, 1, and 0.

**SCSI bus**

A SCSI bus provides a means of transferring data between SCSI devices. A SCSI bus is either an 8- or 16-bit bus that supports up to 8 or 16 devices, including itself. The bus can consist of any mix of initiators and targets, with the requirement that at least one initiator and one target must be present.

**SCSI device**

A SCSI device is a single unit on a SCSI bus that originates or services SCSI commands. A SCSI device is identified by a unique SCSI address. SCSI devices can act as initiators or targets.

**SCSI port**

A SCSI port is an opening at the back of a router that provides connection between the SCSI adapter and SCSI bus.

**SMB**

Short for *Server Message Block*. A protocol for Windows clients. SMB uses the TCP/IP protocol. It is viewed as a complement to the existing internet application protocols such as FTP and HTTP. With SMB, you can access local server files, obtain read-write privileges to local server files, share files with other clients, and restore connections automatically if the network fails.

**SMTP**

Short for *Simple Mail Transfer Protocol*. A TCP/IP protocol used for sending and receiving email.

**SNTP**

Short for *Simple Network Time Protocol*. A TCP/IP protocol used for clock synchronization between computer systems over data networks.

**SNMP**

Short for *Simple Network Management Protocol*. A system to monitor and manage network devices such as computers, routers, bridges, and hubs. SNMP views a network as a collection of cooperating, communicating devices, consisting of managers and agents.
SSH

Short for Secure Shell. A service that provides a remote console for special system administration and customer support access to the server. SSH is similar to telnet but more secure, providing strong encryption so that no passwords cross the network in clear text.

SSL

Short for Secure Sockets Layer. A protocol for managing the security of a message sent on the internet. It is a type of technology that provides data encryption, server authentication, message integrity, and client authentication for any TCP/IP connection.

Standalone

A network bonding mode which treats each port as a separate interface. This configuration should be used only in multihomed environments in which network storage resources must reside on two separate subnets.

Static IP Address

An IP address defined by the system administrator rather than by an automated system, such as DHCP.

Storage Area Network

See SAN.

Subnet Mask

A portion of a network that shares a common address component. On TCP/IP networks, subnets are all devices with IP addresses that have the same prefix.

Tape Cartridge

A magnetically coated strip of plastic in a plastic housing on which data can be encoded. Storing data on tapes is considerably cheaper than storing data on disks. Tapes also have large storage capacities, extending up to hundreds of gigabytes. They are generally used for long-term storage and backup, or for transporting large amounts of data. Tapes come in a variety of sizes and formats.

Tape Drive

A device, that reads data from and writes it onto a tape.

TCP/IP

Short for Transmission Control Protocol/Internet Protocol. The basic protocol used for data transmission over the internet.

Telnet

A terminal emulation program for TCP/IP networks such as the Internet. The Telnet program runs on a computer and connects it to a server on the network. You enter commands through the Telnet program and they will be executed as if you were entering them directly on the server console. This enables you to control the server and communicate with other servers on the network. To start a Telnet session, you must log in to a server by entering a valid user name and password. Telnet is a common way to remotely control Web servers.
Topology

Logical layout of the parts of a computer system or network and their interconnections. There are two types of topology: physical and logical. The physical topology of a network refers to the configuration of cables, computers, and other peripherals. Logical topology is the method used to pass the information between workstations.

Trap

A signal from a device informing an SNMP management program that an event has occurred.

U

A standard unit of measure for designating the height in computer enclosures and rack cabinets. One U equals 1.75 inches. For example, a 3U server chassis is 5.25 inches high.

UDP

Short for User Datagram Protocol. A communications protocol for sending messages between computers in a network that uses the Internet Protocol (IP). UDP is an alternative to the Transmission Control Protocol but, unlike TCP, does not guarantee reliability or ordering of data packets.

UPS

Short for Uninterruptible Power Supply. A device that allows a computer to keep running for a short time when the primary power source is lost. It also provides protection from power surges. A UPS device contains a battery that starts when the device senses a loss of power from the primary source.

URL

Short for Uniform Resource Locator. A Web address.

USB Port

USB is short for Universal Serial Bus. A USB port is a hardware interface for low-speed peripherals such as the keyboard, mouse, joystick, scanner, printer, and telephony devices.

VLAN

Short for Virtual LAN. It consists of a network of computers that behave as if they are connected to the same wire - even though they may actually be physically connected to different segments of a LAN.

Web Management Interface

A Web-based utility used for configuration and ongoing maintenance, such as monitoring server conditions, configuring email alerts for key events, or for SNMP management.

Windows Domain Authentication

Windows-based networks use a domain controller to store user credentials. The domain controller can validate all authentication requests on behalf of other systems in the domain. The domain controller can also generate encrypted challenges to test the validity of user credentials. Other systems use encrypted challenges to respond to CIFS/SMB clients that request access to a share.
WINS

Short for *Windows Internet Naming Service*. The server that locates network resources in a TCP/IP-based Windows network by automatically configuring and maintaining the name and IP address mapping tables.

Workgroup

A collection of computers that are grouped for sharing resources such as data and peripherals over a LAN. Each workgroup is identified by a unique name.
